Tektronix warrants that the product will be free from defects in materials and workmanship for a period of three (3) years from the date of original purchase from an authorized Tektronix distributor. If the product proves defective during this warranty period, Tektronix, at its option, either will repair the defective product without charge for parts and labor, or will provide a replacement in exchange for the defective product. Batteries are excluded from this warranty. Parts, modules and replacement products used by Tektronix for warranty work may be new or reconditioned to like new performance. All replaced parts, modules and products become the property of Tektronix.

In order to obtain service under this warranty, Customer must notify Tektronix of the defect before the expiration of the warranty period and make suitable arrangements for the performance of service. Customer shall be responsible for packaging and shipping the defective product to the service center designated by Tektronix, shipping charges prepaid, and with a copy of customer proof of purchase. Tektronix shall pay for the return of the product to Customer if the shipment is to a location within the country in which the Tektronix service center is located. Customer shall be responsible for paying all shipping charges, duties, taxes, and any other charges for products returned to any other locations.

This warranty shall not apply to any defect, failure or damage caused by improper use or improper or inadequate maintenance and care. Tektronix shall not be obligated to furnish service under this warranty a) to repair damage resulting from attempts by personnel other than Tektronix representatives to install, repair or service the product; b) to repair damage resulting from improper use or connection to incompatible equipment; c) to repair any damage or malfunction caused by the use of non-Tektronix supplies; or d) to service a product that has been modified or integrated with other products when the effect of such modification or integration increases the time or difficulty of servicing the product.

THIS WARRANTY IS GIVEN BY TEKTRONIX WITH RESPECT TO THE PRODUCT IN LIEU OF ANY OTHER WARRANTIES, EXPRESS OR IMPLIED. TEKTRONIX AND ITS VENDORS DISCLAIM ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. TEKTRONIX’ RESPONSIBILITY TO REPAIR OR REPLACE DEFECTIVE PRODUCTS IS THE SOLE AND EXCLUSIVE REMEDY PROVIDED TO THE CUSTOMER FOR BREACH OF THIS WARRANTY. TEKTRONIX AND ITS VENDORS WILL NOT BE LIABLE PROVIDED TO THE CUSTOMER FOR BREACH OF THIS WARRANTY. TEKTRONIX AND ITS VENDORS WILL NOT BE LIABLE TO THE CUSTOMER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES IRRESPECTIVE OF WHETHER TEKTRONIX OR THE VENDOR HAS ADVANCE NOTICE OF THE POSSIBILITY OF SUCH DAMAGES.

General Safety Summary

Review the following safety precautions to avoid injury and prevent damage to this product or any products connected to it.

To avoid potential hazards, use this product only as specified.

Only qualified personnel should perform service procedures.

To Avoid Fire or Personal Injury

**Use Proper Power Cord.** Use only the power cord specified for this product and certified for the country of use.

**Connect and Disconnect Properly.** Do not connect or disconnect probes or test leads while they are connected to a voltage source.

**Connect and Disconnect Properly.** De-energize the circuit under test before connecting or disconnecting the current probe.

**Ground the Product.** This product is grounded through the grounding conductor of the power cord. To avoid electric shock, the grounding conductor must be connected to earth ground. Before making connections to the input or output terminals of the product, ensure that the product is properly grounded.

**Observe All Terminal Ratings.** To avoid fire or shock hazard, observe all ratings and markings on the product. Consult the product manual for further ratings information before making connections to the product.

Connect the probe reference lead to earth ground only.

Do not apply a potential to any terminal, including the common terminal, that exceeds the maximum rating of that terminal.

**Power Disconnect.** The power cord disconnects the product from the power source. Do not block the power cord; it must remain accessible to the user at all times.

**Do Not Operate Without Covers.** Do not operate this product with covers or panels removed.

**Do Not Operate With Suspected Failures.** If you suspect that there is damage to this product, have it inspected by qualified service personnel.

**Avoid Exposed Circuitry.** Do not touch exposed connections and components when power is present.

**Do Not Operate in Wet/Damp Conditions.**

**Do Not Operate in an Explosive Atmosphere.**

**Keep Product Surfaces Clean and Dry.**

**Provide Proper Ventilation.** Refer to the manual’s installation instructions for details on installing the product so it has proper ventilation.

Terms in this Manual

These terms may appear in this manual:

---

**WARNING.** Warning statements identify conditions or practices that could result in injury or loss of life.
CAUTION. Caution statements identify conditions or practices that could result in damage to this product or other property.

Symbols and Terms on the Product

These terms may appear on the product:

- **DANGER** indicates an injury hazard immediately accessible as you read the marking.
- **WARNING** indicates an injury hazard not immediately accessible as you read the marking.
- **CAUTION** indicates a hazard to property including the product.

The following symbol(s) may appear on the product:
Compliance Information

This section lists the EMC (electromagnetic compliance), safety, and environmental standards with which the instrument complies.

EMC Compliance

EC Declaration of Conformity – EMC

Meets intent of Directive 2004/108/EC for Electromagnetic Compatibility. Compliance was demonstrated to the following specifications as listed in the Official Journal of the European Communities:

**EN 61326-1:2006, EN 61326-2-1:2006.** EMC requirements for electrical equipment for measurement, control, and laboratory use. ¹ ² ³ ⁴

¹ This product is intended for use in nonresidential areas only. Use in residential areas may cause electromagnetic interference.

² Emissions which exceed the levels required by this standard may occur when this equipment is connected to a test object.

³ To ensure compliance with the EMC standards listed here, high quality shielded interface cables should be used.

⁴ Instrument rebooting may be experienced where the EUT takes longer than 10 seconds to recover from the IEC 61000-4-11 transient immunity test.

⁵ The increase in trace noise while subjected to the test field (3 V/m over the frequency range 80 MHz to 1 GHz, 1.4 GHz to 2.0 GHz, and 1 V/m from 2.0 GHz to 2.7 GHz, with 80% amplitude modulation at 1 kHz) is not to exceed 1 major division of induced noise in the channel at 20 mV/div, sample mode, 100 us/div. (IEC 61000-4-3).

⁶ The increase in trace noise while subjected to the injected test signal (3 V rms over the frequency range of 150 kHz to 80 MHz, with 80% amplitude modulation at 1 kHz) is not to exceed 1 major division of induced noise in the channel at 20 mV/div, sample mode, 100 us/div (IEC 61000-4-6).

⁷ Performance Criterion C applied at the 70%/25 cycle Voltage-Dip and the 0%/250 cycle Voltage-Interruption test levels (IEC 61000-4-11).
Australia / New Zealand Declaration of Conformity – EMC

Complies with the EMC provision of the Radiocommunications Act per the following standard, in accordance with ACMA:

Safety Compliance

EC Declaration of Conformity – Low Voltage

Compliance was demonstrated to the following specification as listed in the Official Journal of the European Communities:

- Low Voltage Directive 2006/95/EC.
- EN 61010-1: 2001. Safety requirements for electrical equipment for measurement control and laboratory use.

U.S. Nationally Recognized Testing Laboratory Listing

Safety Class

Class 1 – grounded product.

Pollution Degree Description

A measure of the contaminants that could occur in the environment around and within a product. Typically the internal environment inside a product is considered to be the same as the external. Products should be used only in the environment for which they are rated.

- Pollution Degree 1. No pollution or only dry, nonconductive pollution occurs. Products in this category are generally encapsulated, hermetically sealed, or located in clean rooms.

- Pollution Degree 2. Normally only dry, nonconductive pollution occurs. Occasionally a temporary conductivity that is caused by condensation must be expected. This location is a typical office/home environment. Temporary condensation occurs only when the product is out of service.

- Pollution Degree 3. Conductive pollution, or dry, nonconductive pollution that becomes conductive due to condensation. These are sheltered locations where neither temperature nor humidity is controlled. The area is protected from direct sunshine, rain, or direct wind.

- Pollution Degree 4. Pollution that generates persistent conductivity through conductive dust, rain, or snow. Typical outdoor locations.
Compliance Information

**Pollution Degree**
Pollution Degree 2 (as defined in IEC 61010-1). Note: Rated for indoor use only.

**Installation (Overvoltage) Category Descriptions**
Terminals on this product may have different installation (overvoltage) category designations. The installation categories are:

- **Measurement Category IV.** For measurements performed at the source of low-voltage installation.
- **Measurement Category III.** For measurements performed in the building installation.
- **Measurement Category II.** For measurements performed on circuits directly connected to the low-voltage installation.
- **Measurement Category I.** For measurements performed on circuits not directly connected to MAINS.

**Overvoltage Category**
Overvoltage Category II (as defined in IEC 61010-1).
Environmental Considerations

This section provides information about the environmental impact of the product.

**Product End-of-Life Handling**

Observe the following guidelines when recycling an instrument or component:

**Equipment Recycling.** Production of this equipment required the extraction and use of natural resources. The equipment may contain substances that could be harmful to the environment or human health if improperly handled at the product’s end of life. In order to avoid release of such substances into the environment and to reduce the use of natural resources, we encourage you to recycle this product in an appropriate system that will ensure that most of the materials are reused or recycled appropriately.

This symbol indicates that this product complies with the applicable European Union requirements according to Directives 2002/96/EC and 2006/66/EC on waste electrical and electronic equipment (WEEE) and batteries. For information about recycling options, check the Support/Service section of the Tektronix Web site (www.tektronix.com).

**Mercury Notification.** This product uses an LCD backlight lamp that contains mercury. Disposal may be regulated due to environmental considerations. Please contact your local authorities or, within the United States, refer to the E-cycling Central Web page (www.eiae.org) for disposal or recycling information.

**Restriction of Hazardous Substances**

This product has been classified as Monitoring and Control equipment, and is outside the scope of the 2002/95/EC RoHS Directive.

Key Features

MSO3000 and DPO3000 series instruments can help you verify, debug, and characterize electronic designs. Key features include:

- 500 MHz, 300 MHz, and 100 MHz bandwidths
- 2 channel and 4 channel models
- Sample rates up to 2.5 GS/s on all analog channels
- 5 M points record length on all channels
- 50,000 waveforms/second display rate
- I²C, SPI, CAN, LIN, RS-232, RS-422, RS-485, UART, I²S, Left Justified (LJ), Right Justified (RJ), TDM bus triggering and analysis (with the appropriate application module and model oscilloscope)
- Power analysis application module (optional)
- Wave Inspector controls for managing long record lengths, with zoom and pan, play and pause, search and mark
- 229 mm (9 inch), with 800 x 480 resolution, WVGA color display
- Small and lightweight, at 127 mm (5 inches) deep and 4.1 kg (9 pounds)
- USB available for quick and easy storage
- Direct printing to any PictBridge-compatible printer
- Built-in Ethernet port
- USB 2.0 device port for direct PC control of the oscilloscope using USBTMC protocol
- OpenChoice documentation and analysis software
- NI LabVIEW SignalExpress™ Tektronix Edition productivity and analysis software
- Remote viewing and control with e*Scope
- Remote control with VISA connectivity
- TekVPI Versatile Probe Interface supports active, differential, and current probes for automatic scaling and units

MSO3000 Series Mixed Signal Oscilloscopes also offer:

- MagniVu 121.2 ps resolution
- Parallel bus triggering and analysis
- 16 digital channels
- Easy connection to your device-under-test through the convenient design of the P6316 digital probe

Operating Considerations

**MSO3000 and DPO3000 Series Oscilloscopes**

- Power Supply Input Voltage: 100 V to 240 V ± 10%
- Power Supply Input Power Frequency:
  - 50/60 Hz at 100 V to 240 V
  - 400 Hz ± 10% at 115 V
- Power Consumption: 120 W maximum
- Weight: 4.2 kg (9.2 lbs), standalone instrument
- Height, including feet but not handle: 203.2 mm (8 in)
- Width, 416.6 mm (16.4 in)
- Depth, 147.4 mm (5.8 in)
- Clearance: 51 mm (2 in)

- Temperature:
  - Operating: 0 °C to +50 °C (+32 °F to +122 °F)
  - Nonoperating: -40 °C to +71 °C (-40 °F to +160 °F)

- Humidity:
  - Operating: 5% to 95% relative humidity (RH) at up to +30 °C
  - Operating: 5% to 45% relative humidity (RH) above +30 °C up to +50 °C, non-condensing, and as limited by a Maximum Wet-Bulb Temperature of +38 °C (derates relative humidity to 45% RH at +50 °C)
  - Non-operating: 5% to 95% Relative Humidity (RH) at up to +30 °C
  - Non-operating: 5% to 45% Relative Humidity (RH) above +30 °C up to +50 °C, non-condensing, and as limited by a Maximum Wet-Bulb Temperature of +38 °C (derates relative humidity to 27% RH at 60 °C)

- Altitude:
  - Operating: 3,000 m (9,843 ft)
  - Nonoperating Altitude: 12,000 m (39,370 ft)

- Random Vibration:
  - Operating: 0.31 G_{RMS}, 5 – 500 Hz, 10 minutes per axis, 3 axes (30 minutes total)
  - Non-operating: 2.46 G_{RMS}, 5 – 500 Hz, 10 minutes per axis, 3 axes (30 minutes total)

- Pollution Degree: 2, Indoor use only

- Acquisition System: 1 MΩ
  
The maximum input voltage: At front panel connector, 300 V_{RMS}, Installation Category II; for measurements performed on circuits directly connected to the low-voltage installation.
Installation

Acquisition System: 50 Ω and 75 Ω
The maximum input voltage: \(5 \text{ V}_{\text{RMS}}\) with a peak at ±20 V. For Installation Category I measurements. Not for connection to Installation Category II, III, or IV circuits.

Acquisition System: Digital Inputs
The maximum input voltage at the input for the digital probe is +30 V to -20 V peak.

Aux In: 1 MΩ
The maximum input voltage: At the front-panel connector, 300 \(\text{V}_{\text{RMS}}\). Installation Category II; for measurements performed on circuits directly connected to the low-voltage installation.

**CAUTION.** To ensure proper cooling, keep the sides and rear of the instrument clear of obstructions.

Total Probe Power:
If the total probe power requirements exceed the available power from the oscilloscope, connect the external AC adapter (Tektronix part number 119-7465-XX) to the rear-panel Probe Power connector.

Maximum Probe Power Available Per Channel (3 or 5 TekVPI Interfaces):
5 V ± 5%, 50 mA max., 250 mW max.
12 V ± 10%, 2 A max., 24 W max.

**P6139A Passive Probe**

Input Voltage:
- \(400 \text{ V}_{\text{RMS}}\) or 400 V DC; CAT I (2,500 \(V_{pk}\) transient)
- \(300 \text{ V}_{\text{RMS}}\) or 300 V DC; CAT II (2,500 \(V_{pk}\) transient)
- \(150 \text{ V}_{\text{RMS}}\) or 150 V DC; CAT III (2,500 \(V_{pk}\) transient)

For steady-state, sinusoidal waveforms, derate at 20 dB/decade above 2.5 MHz to 50 \(\text{V}_{\text{RMS}}\) at 20 MHz and above.

Output Voltage (terminated into 1 MΩ):
- \(40 \text{ V}_{\text{RMS}}\) or 40 V DC; CAT I (2,500 \(V_{pk}\) impulse)
- \(30 \text{ V}_{\text{RMS}}\) or 30 V DC; CAT I (250 \(V_{pk}\) impulse)
- \(15 \text{ V}_{\text{RMS}}\) or 15 V DC; CAT I (250 \(V_{pk}\) impulse)

Temperature:
- Operating: -15 °C to +65 °C ( +5 °F to +149 °F)
- Nonoperating: -62 °C to +85 °C ( -80 °F to +185 °F)

Altitude: \(\leq 2,000 \text{ m} \) (\(\leq 6,562 \text{ ft}\))

Pollution Degree: 2, Indoor use only

Humidity:
- Operating: High: 40 °C to 50 °C, 10% to 60% RH
- Operating: Low: 0 °C to 40 °C, 10 to 90% RH

Cleaning

Inspect the oscilloscope and probes as often as operating conditions require. To clean the exterior surface, perform the following steps:

1. Remove loose dust on the outside of the oscilloscope and probes with a lint-free cloth. Use care to avoid scratching the clear glass display filter.

2. Use a soft cloth dampened with water to clean the oscilloscope. Use an aqueous solution of 75% isopropyl alcohol for more efficient cleaning.

\textbf{CAUTION.} To avoid damage to the surface of the oscilloscope or probes, do not use any abrasive or chemical cleaning agents.
Connecting Probes

The oscilloscope supports probes with the following:

1. Tektronix Versatile Probe Interface (TekVPI)
   These probes support two-way communication with the oscilloscope through on-screen menus and remotely through programmable support. The remote control is useful in applications like ATE where you want the system to preset probe parameters.

2. TPA-BNC Adapter
   The TPA-BNC Adapter allows you to use TEKPROBE II probe capabilities, such as providing probe power, and passing scaling and unit information to the oscilloscope.

3. Plain BNC Interfaces
   Some of these use TEKPROBE capabilities to pass the waveform signal and scaling to the oscilloscope. Some only pass the signal and there is no other communication.
4. Digital Probe Interface (MSO3000 Series only)
   The P6316 probe provides 16 channels of digital (on or off state) information.

For more information on the many probes available for use with MSO3000 and DPO3000 series oscilloscopes, refer to www.tektronix.com.

Securing the Oscilloscope

1. Use a standard laptop computer style security lock to secure your oscilloscope to your location.
Powering On the Oscilloscope

Ground the Oscilloscope and Yourself

Before pushing the power switch, connect the oscilloscope to an electrically neutral reference point, such as earth ground. Do this by plugging the three-pronged power cord into an outlet grounded to earth ground.

Grounding the oscilloscope is necessary for safety and to take accurate measurements. The oscilloscope needs to share the same ground as any circuits that you are testing.

If you are working with static sensitive components, ground yourself. Static electricity that builds up on your body can damage static-sensitive components. Wearing a grounding strap safely sends static charges on your body to earth ground.
To connect the power cord and power on the oscilloscope:

Powering Off the Oscilloscope

To power off the oscilloscope and remove the power cord:

Functional Check

Perform this quick functional check to verify that your oscilloscope is operating correctly.

1. Connect the oscilloscope power cable as described in Powering On the Oscilloscope. (See page 10.)
2. Power on the oscilloscope.

3. Connect the P6139A probe tip and reference lead to the PROBE COMP connectors on the oscilloscope.

5. Push Autoset. The screen should now display a square wave, approximately 2.5 V at 1 kHz.

**NOTE.** For best performance, it is recommended that you set the Vertical scale to 500 mV.

If the signal appears but is misshapen, perform the procedures for compensating the probe. (See page 13, *Compensating a Passive Voltage Probe*.)

If no signal appears, rerun the procedure. If this does not remedy the situation, have the instrument serviced by qualified service personnel.

**Compensating a Passive Voltage Probe**

Whenever you attach a passive voltage probe for the first time to any input channel, compensate the probe to match it to the corresponding oscilloscope input channel.

To properly compensate your passive probe:

1. Follow the steps for the functional check. (See page 11, *Functional Check*.)

2. Check the shape of the displayed waveform to determine if your probe is properly compensated.

   ![Properly compensated, Under compensated, Over compensated waveforms]
3. If necessary, adjust your probe. Repeat as needed.

Quick Tips

Use the shortest possible ground lead and signal path to minimize probe-induced ringing and distortion on the measured signal.
Application Module Free Trial

A 30-day free trial is available for all application modules not installed in your oscilloscope. The trial period begins when you power on the oscilloscope for the first time.

After 30 days, you must purchase the module if you want to continue using the application. To see the date when your free trial period expires, push the front panel Utility button, push the lower-bezel Utility Page button, use multipurpose knob a to select Config, and push the lower-bezel About button.

Installing an Application Module

**CAUTION.** To avoid damage to the oscilloscope or application module, observe ESD (electrostatic discharge) precautions. (See page 10, Powering On the Oscilloscope.)

Turn off the oscilloscope power while removing or adding an application module.

(See page 11, Powering Off the Oscilloscope.)

Optional application module packages extend the capability of your oscilloscope. You can install up to four application modules at one time. Application modules go into the two slots with windows in the upper right corner of the front panel. Two additional slots are directly behind the two that you can see. To use these slots, install the module with the label facing away from you.

Refer to the Tektronix 3000 Series Oscilloscopes Application Module Installation Instructions that came with your application module for instructions on installing and testing an application module.

**NOTE.** If you remove an application module, the features provided by the application module become unavailable. To restore the features, turn off the oscilloscope power, reinstall the module and turn on the oscilloscope power.

Changing the User Interface Language

To change the language of the oscilloscope user interface, and to change the front-panel button labels through the use of an overlay:

1. Push Utility.

3. Turn multipurpose knob a and select Config.
4. Push **Language** from the resulting lower-bezel menu.

5. Turn multipurpose knob a and select the desired language. Choose among: English, French, German, Italian, Spanish, Brazilian Portuguese, Russian, Japanese, Korean, Simplified Chinese, and Traditional Chinese.

6. If you choose to use English, be sure that the plastic front-panel overlay is removed. If you choose a language other than English, place the plastic overlay for the language that you desire over the front panel to display labels in that language.

---

**Changing the Date and Time**

To set the internal clock with the current date and time:

1. Push **Utility**.

2. Push **Utility Page**.
3. Turn multipurpose knob a and select Config.

4. Push Set Date & Time.

5. Push the side-bezel buttons and turn both multipurpose knobs (a and b) to set the time and date values.

6. Push OK Set Date & Time.
Signal Path Compensation

Signal Path Compensation (SPC) corrects for DC inaccuracies caused by temperature variations and/or long-term drift. Run the compensation whenever the ambient temperature has changed by more than 10 °C (18 °F) or once a week if you use vertical settings of 5 mV/division or less. Failure to do so may result in the instrument not meeting warranted performance levels at those volts/div settings.

To compensate the signal path:

1. Warm up the oscilloscope for at least 20 minutes. Remove all input signals (probes and cables) from channel inputs. Input signals with AC components adversely affect SPC.

4. Turn multipurpose knob a and select Calibration.

5. Push Signal Path from the lower-bezel menu.
6. Push **OK Compensate Signal Paths** from the resulting side-bezel menu.

The calibration will take approximately 10 minutes to complete.

7. After calibration, verify that the status indicator on the lower-bezel menu displays **Pass**.

If it does not, then recalibrate the instrument or have the instrument serviced by qualified service personnel.

Service personnel use the factory calibration functions to calibrate the internal voltage references of the oscilloscope using external sources. Refer to your Tektronix field office or representative for assistance with factory calibration.

**NOTE.** Signal Path Compensation does not include calibration to the probe tip. (See page 13, Compensating a Passive Voltage Probe.)

---

**Upgrading Firmware**

To upgrade the firmware of the oscilloscope:

1. Open up a Web browser and go to www.tektronix.com/software. Proceed to the software finder. Download the latest firmware for your oscilloscope on your PC.

Unzip the files and copy the firmware.img file into the root folder of a USB flash drive.
2. Power off your oscilloscope.

3. Insert the USB flash drive into the front-panel USB port on your oscilloscope.
4. Power on the oscilloscope. The instrument automatically recognizes the replacement firmware and installs it.

If the instrument does not install the firmware, rerun the procedure. If the problem continues, try a different model of USB flash drive. Finally, if needed, contact qualified service personnel.

**NOTE.** Do not power off the oscilloscope or remove the USB flash drive until the oscilloscope finishes installing the firmware.

5. Power off the oscilloscope and remove the USB flash drive.
6. Power on the oscilloscope.

9. Turn multipurpose knob a and select Config.

10. Push About. The oscilloscope displays the firmware version number.

11. Confirm that the version number matches that of the new firmware.
Connecting Your Oscilloscope to a Computer

You may want to document your work for future reference. Instead of saving screen images and waveform data to a USB flash drive, and then generating a report later, you may want to send the image or waveform data directly to a remote PC for analysis. You may also want to control an oscilloscope at a remote location from your computer. (See page 122, Saving a Screen Image.) (See page 123, Saving and Recalling Waveform Data.)

Two ways to connect your oscilloscope to a computer are through the VISA drivers and the e*Scope Web-enabled tools. Use VISA to communicate with your oscilloscope from your computer through a software application. Use e*Scope to communicate with your oscilloscope through a Web browser.

Using VISA

VISA lets you use your MS-Windows computer to acquire data from your oscilloscope for use in an analysis package that runs on your PC, such as Microsoft Excel, National Instruments LabVIEW, or a program of your own creation. You can use a common communications connection, such as USB, Ethernet, or GPIB, to connect the computer to the oscilloscope.

To set up VISA communications between your oscilloscope and a computer:

1. Load the VISA drivers on your computer.
   You will find the drivers on the appropriate CD that comes with your oscilloscope or at the Tektronix software finder Web page (www.tektronix.com/software).

2. Connect the oscilloscope to your computer with the appropriate USB or Ethernet cable.

   To communicate between the oscilloscope and a GPIB system, connect the oscilloscope to the TEK-USB-488 GPIB-to-USB Adapter with a USB cable. Then connect the adapter to your GPIB system with a GPIB cable. Cycle the power on the oscilloscope.

5. Turn multipurpose knob a and select I/O.

6. If you are using USB, the system sets itself up automatically for you, if USB is enabled. Check USB on the lower-bezel menu to be sure that USB is enabled. If it is not enabled, push USB. Then push Connect to Computer on the side-bezel menu.

7. To use Ethernet, push Ethernet Network Settings. On the side-bezel menu, if you are on a DHCP Ethernet network and using a through cable, set DHCP to On. If you are using a cross-over cable, set it to Off and set a hard coded TCPIP address.

8. If you are using GPIB, push GPIB. Enter the GPIB address on the side-bezel menu, using multipurpose knob a. This will set the GPIB address on an attached TEK-USB-488 Adapter.
9. Run your application software on your computer.

Quick Tips

- The CD that is shipped with your oscilloscope includes a variety of Windows-based software tools designed to ensure efficient connectivity between your oscilloscope and your computer. There are toolbars that speed connectivity with Microsoft Excel and Word. There is also a standalone acquisition program called the OpenChoice Desktop.

- The rear-panel USB 2.0 device port is the correct USB port for computer connectivity. Use the rear- and front-panel USB 2.0 host ports to connect your oscilloscope to USB flash drives and printers. Use the USB Device port to connect your oscilloscope to a PC or a PictBridge printer.

Using e*Scope

e*Scope lets you access any Internet-connected MSO3000 and DPO3000 series oscilloscope from a browser on your workstation, PC, or laptop computer. No matter where you are, your oscilloscope is as close as the nearest browser.
To set up e*Scope communications between your oscilloscope and a Web browser running on a remote computer:

1. Connect the oscilloscope to your computer network with the appropriate Ethernet cable. If you are connecting directly to your computer, you need a Crossover Ethernet Cable. If you are connecting to a network or a hub you need a Straight Through Ethernet Cable.

4. Turn multipurpose knob a and select I/O.

6. On the side-bezel menu, if you are on a DHCP Ethernet network and using dynamic addressing, set DHCP to **On**. If you are using static addressing, set it to **Off**.

Push **Change Instrument Settings**. If you are using DHCP, note the Ethernet address and instrument name. If you are using Static addressing, enter the Ethernet address you will be using.

**NOTE.** Depending on the type and speed of network to which your DPO3000 series oscilloscope is connected, you may not see the DHCP/BOOTP field update instantaneously after pressing the DHCP/BOOTP button. It may take a few seconds to update.

7. Start your browser on your remote computer.
   In the browser address line, enter the IP address or, if DHCP is set to **On** in the oscilloscope, simply enter the instrument name.

8. You should now see the e*Scope screen showing the oscilloscope display, on your Web browser.
   If e*Scope does not work, rerun the procedure. If it still does not work, contact qualified service personnel.

---

**Connecting a USB Keyboard to Your Oscilloscope**

You can connect a US-style USB keyboard to a USB Host port on the rear or front panel of the oscilloscope. The oscilloscope will detect the keyboard, even if it is plugged in while the oscilloscope is powered on.

You can use the keyboard to quickly create names or labels. You can bring up the Label menu through the lower-bezel label button of the Channel or Bus menus. Use the arrow keys on the keyboard to move the insertion point, and then type in a name or label. Labeling channels and buses makes the information on the screen easier to identify.
Get Acquainted with the Instrument

Front-Panel Menus and Controls

The front panel has buttons and controls for the functions that you use most often. Use the menu buttons to access more specialized functions.

Using the Menu System

To use the menu system:

1. Push a front-panel menu button to display the menu that you want to use.

2. Push a lower-bezel button to select a menu item. If a pop-out menu appears, turn multipurpose knob a to select the desired choice. If a pop-up menu appears, press the button again to select the desired choice.
3. Push a side-bezel button to choose a side-bezel menu item.
   If the menu item contains more than one choice, push the side-bezel button repeatedly to cycle through the choices.
   If a pop-out menu appears, turn multipurpose knob a to select the desired choice.

4. To remove a side-bezel menu, push the lower-bezel button again or push Menu Off.
5. Certain menu choices require you to set a numeric value to complete the setup. Use the upper and lower multipurpose knobs a and b to adjust values.

6. Push Fine to turn off or on the ability to make smaller adjustments.

Using the Menu Buttons

Use the menu buttons to perform many functions in the oscilloscope.

1. **Measure.** Push to perform automated measurements on waveforms or to configure cursors.

2. **Search.** Push to search through an acquisition for user-defined events/criteria.

3. **Test.** Push to activate advanced or application-specific testing features.

4. **Acquire.** Push to set the acquisition mode and adjust the record length.

5. **Autoset.** Push to perform an automatic setup of oscilloscope settings.

6. **Trigger Menu.** Push to specify trigger settings.

7. **Utility.** Push to activate the system utility functions, such as selecting a language or setting the date/time.
8. **Save / Recall Menu.** Push to save and recall setups, waveforms, and screen images to internal memory or a USB flash drive.

9. **Channel 1,2,3, or 4 Menu.** Push to set vertical parameters for input waveforms and to display or remove the corresponding waveform from the display.
10. **B1 or B2.** Push to define and display a bus if you have the appropriate module application keys. The DPO3AUTO module supports CAN and LIN buses. The DPO3EMBD module supports I²C and SPI. The DPO3COMP module supports RS-232, RS-422, RS-485, and UART buses. The DPO3AUDIO module supports I²S, Left Justified (LJ), Right Justified (RJ), and TDM buses. Also, push the B1 or B2 button to display or remove the corresponding bus from the display.

11. **R.** Push to manage reference waveforms, including the display or removal of each reference waveform from the display.

12. **M.** Push to manage the math waveform, including the display or removal of the math waveform from the display.

**Using Other Controls**

These buttons and knobs control waveforms, cursors, and other data input.

1. Turn the upper multipurpose knob, when activated, to move a cursor, to set a numerical parameter value for a menu item, or to select from a pop-out list of choices. Push the **Fine** button to toggle between coarse and fine adjustment. Screen icons tell you when a or b are active.

2. **Cursors.** Push once to activate the two vertical cursors. Push again to turn on the two vertical and two horizontal cursors. Push again to turn off all cursors.

   When the cursors are on, you can turn the multipurpose knobs to control their position.
3. **Select.** Push to activate special functions. For example, when using the two vertical cursors (and no horizontal ones are visible), you can push this button to link or unlink the cursors. When the two vertical and two horizontal cursors are both visible, you can push this button to make either the vertical cursors or the horizontal cursors active.

4. **Fine.** Push to toggle between making coarse and fine adjustments with the vertical and horizontal position knobs, the trigger level knob, and many operations of multipurpose knobs a and b.

5. **Waveform Intensity.** Push to enable multipurpose knob a to control waveform display intensity and knob b to control graticule intensity.

6. **Turn the lower multipurpose knob b, when activated, to move a cursor or set a numerical parameter value for a menu item. Push Fine to make adjustments more slowly.**

7. **Zoom button.** Push to activate zoom mode.

8. **Pan (outer knob).** Turn to scroll the zoom window through the acquired waveform.

9. **Zoom (inner knob).** Turn to control the zoom factor. Turning it clockwise zooms in further. Turning it counterclockwise zooms out.

10. **Play-pause button.** Push to start or stop the automatic panning of a waveform. Control the speed and direction with the pan knob.

11. **← Prev.** Push to jump to the previous waveform mark.
12. **Set/Clear Mark.** Push to establish or delete a waveform mark.

13. → **Next.** Push to jump to the next waveform mark.

14. **Horizontal Position.** Turn to adjust the trigger point location relative to the acquired waveforms. Push **Fine** to make smaller adjustments.

15. **Horizontal Scale.** Turn to adjust the horizontal scale (time/division).

16. **Run/Stop.** Push to start or stop acquisitions.

17. **Single.** Push to make a single acquisition.

18. **Autoset.** Push to automatically set the vertical, horizontal, and trigger controls for a usable, stable display.

19. **Trigger Level.** Turn to adjust the trigger level. Push this button to set the trigger level to the midpoint of the waveform.

20. **Force Trig.** Push to force an immediate trigger event.

21. **Vertical Position.** Turn to adjust the vertical position of the corresponding waveform. Push **Fine** to make smaller adjustments.

22. **1, 2, 3, 4.** Push to display or remove the corresponding waveform from the display and access the vertical menu.
23. **Vertical Scale.** Turn to adjust the vertical scale factor of the corresponding waveform (volts/division).

24. **Print.** Push to print a screen image using the printer selected in the Utility menu. (See page 128, *Printing a Hard Copy*.)

25. **Power switch.** Push to power on or off the instrument.

26. **USB 2.0 host port.** Insert a USB cable here to connect peripherals to the oscilloscope, such as a keyboard, a printer, or a flash drive. There is one more USB 2.0 host port on the rear panel.

27. **Save.** Push to perform an immediate save operation. The save operation uses the current save parameters, as defined in the Save / Recall menu.

28. **Default Setup.** Push to perform an immediate restore of the oscilloscope to the default settings.

29. **D15 - D0.** Push to display or remove the digital channels from the display, and to access the digital channel setup menu (MSO3000 Series only).
30. **Menu Off.** Push to clear a displayed menu from the screen.

### Identifying Items in the Display

The items shown to the right may appear in the display. Not all of these items are visible at any given time. Some readouts move outside the graticule area when menus are turned off.

1. The acquisition readout shows when an acquisition is running, stopped, or when acquisition preview is in effect. Icons are:
   - **Run:** Acquisitions enabled
   - **Stop:** Acquisitions not enabled
   - **Roll:** In roll mode (40 ms/div or slower)
   - **PreVu:** In this state, the oscilloscope is stopped or between triggers. You can change the horizontal or vertical position or scale to see approximately what the next acquisition will look like.
2. The trigger position icon shows the trigger position in the acquisition.

3. The expansion point icon (an orange triangle) shows the point that the horizontal scale expands and compresses around.

4. The waveform record view shows the trigger location relative to the waveform record. The line color corresponds to the selected waveform color.

5. The trigger status readout shows trigger status. Status conditions are:
   - Trig’d: Triggered
   - Auto: Acquiring untriggered data
   - PrTrig: Acquiring pretrigger data
   - Trig?: Waiting for trigger

6. The cursor readout shows time, amplitude, and delta (Δ) values for each cursor.
   - For FFT measurements, it shows frequency and magnitude.
   - For serial buses, the readout shows the decoded values.
7. The trigger level icon shows the trigger level on the waveform. The icon color corresponds to the trigger source color.

8. The trigger readout shows the trigger source, slope, and level. The trigger readouts for other trigger types show other parameters.

9. The top line of the record length/sampling rate readout shows the sampling rate (adjust with the Horizontal Scale knob). The bottom line shows the record length (adjust with the Acquire menu).

10. The horizontal position/scale readout shows on the top line the horizontal scale (adjust with the Horizontal Scale knob). With Delay Mode on, the bottom line shows the time from the T symbol to the expansion point icon (adjust with the Horizontal Position knob).

   Use horizontal position to insert added delay between when the trigger occurs and when you actually capture the data. Insert a negative time to capture more pretrigger information.

   With Delay Mode off, the bottom line shows the time location of the trigger within the acquisition, as a percentage.

11. The Timing Resolution readout shows the resolution of the digital channel timing.

   Timing resolution is the time between samples. It is the reciprocal of the digital sample rate.

   When the MagniVu control is on, "MagniVu" appears in the readout.
Get Acquainted with the Instrument

12. Measurement readouts show the selected measurements. You can select up to four measurements to display at one time. A symbol appears instead of the expected numerical measurement if a vertical clipping condition exists. Part of the waveform is above or below the display. To obtain a proper numerical measurement, turn the vertical scale and position knobs to make all of the waveform appear in the display.

13. The auxiliary waveform readouts show the vertical and horizontal scale factors of the math and reference waveforms.

14. The channel readout shows the channel scale factor (per division), coupling, invert, and bandwidth status. Adjust with the Vertical Scale knob and the channel menus.

15. For analog channels, the waveform baseline indicator shows the zero-volt level of a waveform (ignoring the effect of offset). The icon colors correspond to the waveform colors.

16. For digital channels (MSO3000 Series only), the baseline indicators point to the high and low levels. The indicator colors match the color code used on the physical probe channels. The D0 indicator is black, the D1 indicator is brown, the D2 indicator is red, and so on.

17. The group icon indicates when digital channels are grouped (MSO3000 Series only).
18. The bus display shows decoded packet level information for serial buses or for parallel buses (MSO3000 Series only). The bus indicator shows the bus number and bus type.

**Front-Panel Connectors**

1. Input Range +30 V to –20 V connector for the P6316 digital probe on MSO3000 models only.

2. Channel 1, 2, (3, 4). Channel inputs with the TekVPI Versatile Probe Interface.

3. **Aux In.** Trigger level range is adjustable from +8 V to –8 V. The maximum input voltage is 450V peak, 300V RMS. Input resistance is 1 MΩ ± 1% in parallel with 11.5 pF ±2 pF.

4. **PROBE COMP.** Square wave signal source to compensate probes. Output voltage: 0 – 2.5V, amplitude ± 1% behind 1 kΩ ±2%. Frequency: 1 kHz.

5. Ground.

6. Application Module Slots.
Get Acquainted with the Instrument

Side-Panel Connector

1. Ground strap connector. This is a receptacle for a grounding strap.

Rear-Panel Connectors

1. Cal. This is for use by authorized service personnel only.

2. Aux Out. Use this output to synchronize other test equipment with your oscilloscope. A LOW to HIGH transition indicates that the trigger occurred. The logic level for Vout (HI) is $\geq 3.25$ V open circuit; $\geq 2.2$ V into a 50Ω load to ground. The logic level for Vout (LO) is $\leq 0.4$ V into a load of $\leq 4$ mA; $\leq 0.2$ V into a 50Ω load to ground.

3. Probe Power. Use this port to provide auxiliary power for TekVPI probes, when needed.

4. Video Out. Use the Video Out port (DB-15 female connector) to show the oscilloscope display on an external monitor or projector.

5. LAN. Use the LAN (Ethernet) port (RJ-45 connector) to connect the oscilloscope to a 10/100 Base-T local area network.
6. **Device.** Use the USB 2.0 High speed device port to control the oscilloscope through USBTMC or GPIB with a TEK-USB-488 Adapter. The USBTMC protocol allows USB devices to communicate using IEEE488 style messages. This lets you run your GPIB software applications on USB hardware. Also, use the USB port to connect a PictBridge-compatible printer to the oscilloscope.

7. **Host.** Use the USB 2.0 Full speed host ports (one on the rear-panel and one on the front) to take advantage of USB flash drives, keyboards, and printers.

8. **Power** input. Attach to an AC power line with integral safety ground. (See page 5, *Operating Considerations.*)
Acquire the Signal

This section describes concepts of and procedures for setting up the oscilloscope to acquire the signal as you want it to.

Setting Up Analog Channels

Use front-panel buttons and knobs to set up your instrument to acquire signals using the analog channels.

1. Connect the P6139A or TekVPI probe to the input signal source.

3. Select the input channel by pushing the front-panel buttons.

   **NOTE.** If you are using a probe that does not supply probe encoding, set the attenuation (probe factor) on the oscilloscope vertical menu for the channel to match the probe.

4. Push Autoset.
5. Push the desired channel button. Then adjust the vertical position and scale.

6. Adjust the horizontal position and scale. The horizontal position determines the number of pretrigger and posttrigger samples. The horizontal scale determines the size of the acquisition window relative to the waveform. You can scale the window to contain a waveform edge, a cycle, several cycles, or thousands of cycles.

Quick Tip

- Use the zoom feature to see multiple cycles of your signal in the upper part, and a single cycle in the lower part of the display. (See page 114, Using Wave Inspector to Manage Long Record Length Waveforms.)

Labeling Channels and Buses

You can add a label to the channels and buses shown on the display for easy identification. The label is placed on the waveform baseline indicator in the left side of the screen. The label can have up to 32 characters.

To label a channel or bus, follow these steps:

1. Push a front panel button for an input channel or a bus.
2. Push a lower-bezel Label button to create a label, such as for channel 1 or B1.

3. Push Select Preset Label to view a list of labels.

4. Turn multipurpose knob b to scroll through the list to find a suitable label. You can edit the label after you insert it if necessary.

5. Push Insert Preset Label to add the label.

If you are using a USB keyboard, use the arrow keys to position the insertion point and edit the inserted label, or type in a new label. (See page 27, Connecting a USB Keyboard to Your Oscilloscope.)

6. If you do not have a USB keyboard connected, push the side- and lower-bezel arrow keys to position the insertion point.
7. Turn multipurpose knob a to scroll through the list of letters, numbers, and other characters to find the character in the name that you want to enter.

8. Push **Select** or **Enter Character** to let the oscilloscope know that you have picked the proper character to use.

You can use the lower-bezel buttons to edit the label as needed.

<table>
<thead>
<tr>
<th>Enter Character</th>
<th>←</th>
<th>→</th>
<th>Back Space</th>
<th>Delete</th>
<th>Clear</th>
</tr>
</thead>
</table>

9. Continue scrolling and pushing **Select** until you have entered all the desired characters. For another label, push the side- and lower-bezel arrow keys to reposition the insertion point.

10. Push **Display Labels** and select **On** to see the label.

**Using the Default Setup**

To return the oscilloscope to its default settings:

1. Push **Default Setup**.
Acquire the Signal

2. If you change your mind, push **Undo Default Setup** to undo the last default setup.

Using Autoset

Autoset adjusts the instrument (acquisition, horizontal, trigger, and vertical controls) such that it displays four or five waveform cycles for analog channels with the trigger near the midlevel, and ten cycles for digital channels.

Autoset works with both the analog and digital channels.

1. Connect the analog probe, and then select the input channel. (See page 44, *Setting Up Analog Channels*.)

2. Push **Autoset** to execute an Autoset.

3. If desired, push **Undo Autoset** to undo the last Autoset.

You can also disable the Autoset function if you want to set up a waveform manually. To disable or enable the Autoset function:

1. Push and hold **Autoset**.

2. Push and hold **Menu Off**.
3. Release Menu Off, and then release Autoset.

4. Select the desired side-bezel setting.

Quick Tips
- To position the waveform appropriately, Autoset may change the vertical position. Autoset always sets vertical offset to 0 V.
- If you use Autoset when no channels are displayed, the instrument turns on channel one (1) and scales it.
- If you use Autoset and the oscilloscope detects a video signal, the oscilloscope automatically sets the trigger type to video and makes other adjustments to display a stable video signal.

Acquisition Concepts
Before a signal can be displayed, it must pass through the input channel where it is scaled and digitized. Each channel has a dedicated input amplifier and digitizer. Each channel produces a stream of digital data from which the instrument extracts waveform records.

Sampling Process
Acquisition is the process of sampling an analog signal, converting it into digital data, and assembling it into a waveform record, which is then stored in acquisition memory.

Real-Time Sampling
MSO3000 and DPO3000 series oscilloscopes use real-time sampling. In real-time sampling, the instrument digitizes all of the points it acquires using a single trigger event.
Waveform Record

The instrument builds the waveform record through use of the following parameters:

- **Sample interval**: The time between recorded sample points. Adjust this by turning the Horizontal Scale knob or changing the record length with the bezel buttons.

- **Record length**: The number of samples required to fill a waveform record. Set this by pushing the Acquire button and using the resulting lower- and side-bezel menus.

- **Trigger point**: The zero time reference in a waveform record. It is shown on the screen by an orange T.

- **Horizontal position**: When Delay Mode is on, this is the time from the trigger point to the expansion point. Adjust this by turning the Horizontal Position knob. Use a positive time to acquire the record after the trigger point. Use a negative time to acquire it before the trigger point.

- **Expansion point**: The point that the horizontal scale expands and contracts around. It is shown by an orange triangle.

How the Analog Acquisition Modes Work

**Sample** mode retains the first sampled point from each acquisition interval. Sample is the default mode.

**Peak Detect** mode uses the highest and lowest of all the samples contained in two consecutive acquisition intervals. This mode only works with real-time, noninterpolated sampling and is useful for catching high frequency glitches.
**Hi Res** mode calculates the average of all the samples for each acquisition interval. This mode only works with real-time, noninterpolated sampling. Hi-Res provides a higher-resolution, lower-bandwidth waveform.

**Envelope** mode finds the highest and lowest record points over all acquisitions. Envelope uses Peak Detect for each individual acquisition.

**Average** mode calculates the average value for each record point over a user-specified number of acquisitions. Average uses Sample mode for each individual acquisition. Use average mode to reduce random noise.

### Changing the Acquisition Mode, Record Length, and Delay Time

Use this procedure to change the acquisition mode.

1. Push **Acquire**.

2. Push **Mode**.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Record Length</th>
<th>Delay</th>
<th>Set Horiz. Position</th>
<th>Waveform Display</th>

</thead>
<tbody>
<tr>
<td>Sample</td>
<td>10k</td>
<td>On</td>
<td>10%</td>
<td>Off</td>
<td>On</td>
</tr>
</tbody>
</table>

2 5 7
3. Then choose the acquisition mode from the side-bezel menu. You can choose from: Sample, Peak Detect, Hi Res, Envelope, or Average.

**NOTE:** Peak Detect and Hi Res modes take advantage of sample points that the oscilloscope would have discarded at lower sweep speeds. Therefore, these modes only work when the current sample rate is less than the maximum possible sample rate. As soon as the oscilloscope starts to acquire at the maximum sample rate, then the Peak Detect, Hi Res and Sample modes all look the same. You can control the sample rate by setting the Horizontal scale and the Record Length.

4. If you chose Average, turn multipurpose knob a to set the number of waveforms to average over.

5. Push Record Length.

6. Push the side-bezel menu, record length button.

   Choose among: 1000, 10 k, 100 k, 1 M, and 5 M points.
7. Push the lower-bezel **Delay** button to select **On** when you want to delay the acquisition relative to the trigger event.

With **Delay** set to **On**, turn the **Horizontal Position** knob counterclockwise to increase the delay. The trigger point will move to the left and ultimately outside of the acquired waveform. Then you can adjust the **Horizontal Scale** knob to acquire more detail around the area of interest at the center of the screen.

When this delay is on, the trigger point separates from the horizontal expansion point. The horizontal expansion point stays at the center of the screen. The trigger point can move off the screen. When this happens, the trigger marker turns to point in the direction of the trigger point.

Use the delay feature when you want to acquire waveform detail that is separated from the trigger event by a significant interval of time. For example, you can trigger on a sync pulse that occurs once every 10 ms and then look at high-speed signal characteristics that occur 6 ms after the sync pulse.

When the delay feature is set to **Off**, the expansion point is tied to the trigger point so that scale changes are centered around the trigger point.

**Using Roll Mode**

Roll mode gives a display similar to a strip chart recorder for low-frequency signals. Roll mode lets you see acquired data points without waiting for the acquisition of a complete waveform record.

Roll mode is enabled when the trigger mode is auto and the horizontal scale is set to 40 ms/div or slower.

**Quick Tips**

- Switching to Envelope or Average acquisition mode, using math waveforms, turning on a bus, or switching to Normal trigger will disable Roll mode.

- Roll mode is disabled when you set the horizontal scale to 20 ms per division or faster.

- Push **Run/Stop** to halt Roll mode.
Setting Up a Serial or Parallel Bus

Your oscilloscope can decode and trigger on signal events or conditions that occur on:

- Parallel buses if you are using an MSO3000 Series oscilloscope
- I²C and SPI serial buses if the DPO3EMBD application module is installed
- RS-232, RS-422, RS-485, and UART serial buses if the DPO3COMP application module is installed
- CAN and LIN serial buses if the DPO3AUTO application module is installed.
- Audio buses (I²S, Left Justified (LJ), Right Justified (RJ), and TDM) if the DPO3AUDIO application module is installed

(See page 15, Application Module Free Trial.)

Using Buses in Two Steps

To quickly use serial bus triggering:

1. Push B1 or B2 and enter parameters of the bus on which to trigger.
   You can separately use B1 and B2 to view two different buses.

2. Push Trigger Menu and enter trigger parameters. (See page 70, Choosing a Trigger Type.)
   You can display bus information without triggering on the bus signal.

Setting Up Bus Parameters

**NOTE.** For all serial bus sources, use any combination of channels 1 through 4, and D15 through D0.

To trigger on serial or parallel bus conditions, refer to Triggering on Buses. (See page 73, Triggering on Buses.)
To set up bus parameters:

1. Push B1 or B2 to bring up the lower-bezel bus menu.

2. Push Bus. Turn multipurpose knob a to scroll through the list of bus types and select the desired bus: Parallel (MSO3000 Series only), I2C, SPI, RS-232, CAN, LIN, or Audio.

The actual menu items shown will depend on your model oscilloscope and the application modules installed.

You can set the threshold for all channels in the serial bus from a list of preset values. The values are based on common types of integrated circuits. The preset values are:

- 1.4 V for TTL
- 2.5 V for 5.0 V CMOS
- 1.65 V for 3.3 V CMOS
- 1.25 V for 2.5 V CMOS
- -1.3 V for ECL
- 3.7 V for PECL
- 0 V

Alternately, you can set the threshold to a specific value for the signals that make up the serial bus. To do so, push the Select side-bezel button and turn multipurpose knob a to select a Bit or a Channel number (Signal name).
Then, turn multipurpose knob \( b \) to define the voltage level above which the oscilloscope treats the signal as a logic high and below which as a logic low.

5. Push **B1 Label** to edit the label for the bus. (See page 45, *Labeling Channels and Buses*.)

<table>
<thead>
<tr>
<th>Bus</th>
<th>Define Inputs</th>
<th>Thresholds</th>
<th>Include R/W in address</th>

<th>Bus Display</th>
<th>Event Table</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

6. Push **Bus Display** and use the side-bezel menu to define how to display the serial bus.

   Push the desired side-bezel menu choice to display the bus data in hexadecimal, binary, ASCII (RS-232 only), or Signed Decimal (Audio only) format.

   - **Hex**
   - **Binary**
   - **ASCII**

7. Push **Event Table** and select **On** to display a list of bus packets with timestamps.

   For an RS-232 bus, the table lists decoded bytes or packets.

8. Push **Save Event Table** to save the event table data in a .csv (spreadsheet) format on the currently selected storage device.
This example of an Event Table is from an RS-232 bus.

RS-232 event tables display one line for each 7- or 8-bit byte when Packets are set to Off.

RS-232 event tables display one line for each packet when Packets are set to On.

I2C, SPI, CAN, and LIN event tables display one line for each packet.

9. Push B1 or B2 and turn multipurpose knob a to move the bus display up or down on the screen.

To acquire data from an I2C bus, you need to also set up these items:

1. If you select I2C, push Define Inputs and the appropriate side-bezel menu choices.

You can assign the predefined SCLK Input or SDA Input to the channel connected to the signal.

2. Push Include R/W in Address and then push the desired side-bezel button.

This control determines how the oscilloscope shows the I2C addresses in bus decode traces, cursor readouts, Event Table listings, and trigger settings.

If you select Yes, the oscilloscope displays 7-bit addresses as eight bits, where the eighth bit (LSB) is the R/W bit. It displays 10-bit addresses as 11 bits where the third bit is the R/W bit.

If you select No, the oscilloscope displays 7-bit addresses as seven bits, and 10-bit addresses as ten bits.

In the physical layer of the I2C protocol, 10 bit I2C addresses are preceded by the five bit code, 11110. The oscilloscope does not include these five bits in address readouts.
To acquire data from an SPI bus, you need to also set up these items:

1. If you selected SPI, push **Define Inputs** and the appropriate side-bezel menu choices.
   
   You can set the **Framing** to SS (Slave Select) or to Idle Time.
   You can assign the predefined SCLK, SS, MOSI, or MISO signals to any channel.

2. Push **Configure** and the desired side-bezel menu choices.

3. Push SCLK to set the edge of the signal to match the SPI bus being acquired.

4. Set the level of the SS, MOSI, and MISO signals to match the SPI bus.
   
   - **Active High** means that a signal is considered active when the signal is greater than the threshold value.
   - **Active Low** means that a signal is considered active when the signal is lower than the threshold value.

5. Use multipurpose knob a to set the number of bits of the SPI Word Size.

6. Push either side bezel button to set the bit order of the SPI bus.

To acquire data from a CAN bus, you need to also set up these items:

1. If you selected CAN, push **Define Inputs** and the appropriate side-bezel menu choices.

   You can set the **Bit Rate** to 500 Kbps or 1 Mbps.
   You can assign the predefined CAN signals to any channel.

   Set the **Bit Order** to MS First or LS First.

   - **Active High** means that a signal is considered active when the signal is greater than the threshold value.
   - **Active Low** means that a signal is considered active when the signal is lower than the threshold value.
Acquire the Signal

2. Turn multipurpose knob a to select the channel connected to the CAN bus source.

3. Turn multipurpose knob a to select the type of CAN signal: CAN_H, CAN_L, Rx, Tx, or Differential.

4. Turn multipurpose knob a to set the Sample Point from 5% to 95% of the position within the bit period or the unit interval.

<table>

5. Push Bit Rate and turn multipurpose knob a to select from the list of predefined bit rates.

Alternately, you can set the bit rate to a specific value. To do so, select Custom, and then turn multipurpose knob b to set the bit rate from 10,000 to 1,000,000.

To acquire data from a LIN bus, you need to also set up these items:

1. If you selected LIN, push Define Inputs and the appropriate side-bezel menu choices.

<table>
<thead>
<tr>
<th>Bus</th>
<th>Define Inputs</th>
<th>Thresholds</th>
<th>Bit Rate</th>
<th>B1 Label</th>

2. Turn multipurpose knob a to select the channel connected to the LIN bus source.

3. Turn multipurpose knob a to set the Sample Point from 5% to 95% of the position within the bit period or the unit interval.

4. Select the Polarity to match the LIN bus being acquired.

5. Push Configure and the appropriate side-bezel menu choices.
6. Push **Bit Rate**, and turn multipurpose knob **a** to select from the list of predefined bit rates. Alternately, you can set the bit rate to a specific value. To do so, select **Custom**, and then turn multipurpose knob **b** to set the bit rate from 800 bps to 100,000 bps.

7. Push **LIN Standard**, and turn multipurpose knob **a** to select the appropriate standard.

8. Push **Include Parity Bits with Id** to select whether or not to include parity bits.
To acquire data from a RS-232 bus, you need to also set up these items:

1. If you selected **RS-232**, push **Configure** and the desired side-bezel menu choices.
   
   Use the side-bezel menu to configure the bus. Use Normal polarity for RS-232 signals and Inverted polarity for RS-422, RS-485, and UART buses.

2. Push **Bit Rate**, and turn multipurpose knob **a** to select the appropriate bit rate.

3. Push **Data Bits** and select the number to match the bus.

4. Push **Parity** and turn multipurpose knob **a** to match the polarity used by the bus as None, Odd, or Even.

5. Push **Packets** and select On or Off.

6. Turn multipurpose knob **a** to select an end-of-packet character.

   RS-232 decoding displays a stream of bytes. You can organize the stream into packets with an end-of-packet character.
To acquire data from an audio bus, you need to also set up these items:

1. If you selected **Audio**, push **Define Input** and the desired side-bezel menu choices.

<table>
<thead>
<tr>
<th>Bus</th>
<th>Define Inputs</th>
<th>Thresholds</th>
<th>Configure</th>
<th>B1 Label</th>
<th>Bus Display</th>
<th>Event Table</th>

<td></td>
</tr>
</tbody>
</table>

2. Push **Type**, and turn multipurpose knob a to select the type of audio bus data configuration on which to trigger.

3. Select **I2S** to trigger on the standard Inter-IC Sound, or Integrated Interchip Sound, electrical serial bus interface standard stereo format.

4. Select **Left Justified** to trigger on an I2S stream where there is no bit clock delay and the data starts right on the edge of the word select clock.

5. Select **Right Justified** to trigger on an I2S stream where the data lines up with the right edge of the word select clock.

6. Select **TDM** to trigger on time-division multiplexing.

7. Push **Configure**, and the appropriate side-menu buttons to further set up I2S triggering.

### Physical Layer Bus Activity

Oscilloscope waveform traces from analog channels 1 to 4, digital channels D15 to D0, and the traces you see when you choose to display a bus as **Bus and Waveforms** always show the physical layer bus activity. In the physical layer display, bits that were transmitted earlier are to the left, and bits that were transmitted later are to the right.

- **I2C** and **CAN** buses transmit the MSB (most significant bit) first
- **SPI** buses do not specify a bit order
- **RS-232** and **LIN** buses transmit the LSB (least significant bit) first

**NOTE.** The oscilloscope displays the decode traces and event tables for all buses with the MSB on the left and LSB on the right.

For example, an RS-232 signal (after the start bit) might be high, high, high, low, high, low, low, and high. Since the RS-232 protocol uses high for zero and low for one, this value would be 0001 0110.
Since the decode displays the MSB first, the oscilloscope reverses the order of the bits and displays 0110 1000. If the bus display is set to hex, the value displays as 68. If the bus display is set to ASCII, the value displays as h.

**RS-232**

If you defined an end-of-packet character to use for RS-232 decoding, the stream of bytes will be displayed as packets.

When decoding an RS-232 bus in ASCII mode, a large dot indicates that the value represents a character outside the printable ASCII range.

### Setting Up Digital Channels

Use front-panel buttons and knobs to set up your instrument to acquire signals using the digital channels.

1. Connect the P6316 16-channel digital probe to the input signal source.

2. Connect the ground lead or leads to the circuit ground.
   
   You can connect one or two of the common ground leads for each group of 8 channels (wires).
3. If needed, connect the appropriate grabber for each probe to the probe tip.

4. Connect each channel to the desired circuit test point.

5. Push the **D15 - D0** front panel button to display the menu.

6. Push the lower-bezel **D15 - D0** button to access the D15 - D0 On or Off menu.

7. Turn multipurpose knob **a** to scroll through the list of digital channels. Turn multipurpose knob **b** to position the selected channel. As you position channels close to each other on the display, the oscilloscope groups the channels, and adds the group to the pop-up list. You can select the group from the list to move all the channels in the group instead of individual channels.

8. Push the lower-bezel **Thresholds** button. You can assign a different threshold value to each pod.

9. Push the lower-bezel **Edit Labels** button and create the label. You can create labels through the front panel or with an optional USB keyboard. (See page 45, *Labeling Channels and Buses*.)

10. Push the lower-bezel **MagniVu** button to increase the timing resolution.
11. Push the lower-bezel **Height** button repeatedly to set the signal height. You only need to do this once to set the height for all of the digital channels.

**Quick Tip**

- Use the zoom feature to see multiple cycles of the signal in the upper part, and a single cycle in the lower part of the display. (See page 114, *Using Wave Inspector to Manage Long Record Length Waveforms*.)
- When setting up the digital probe, the first set of eight leads (pins 7 to 0) on the digital probe is marked Group 1 on the lead box. The second set (pins 15 to 8) is marked Group 2.
- Digital channels store a high or low state for each sample. The threshold that separates a high from a low state can be set for all the channels in Group 1 or in Group 2 of the digital probe. The threshold can not be set for individual channels.

**When and Why to Turn On MagniVu**

For MSO3000 Series only, MagniVu allows you to have higher resolution to accurately determine edge placement. This helps you to make precise timing measurements on digital edges. You can see up to 16 times more detail than with normal digital channel sampling.

The MagniVu record is acquired in parallel with the main digital acquisition and is available at any time, running or stopped. MagniVu provides an ultra high resolution view of your data sampled at a maximum resolution of 121.2 ps for 10,000 points centered around the trigger.

**NOTE.** MagniVu centers itself around the trigger point. If you turn MagniVu on while using a large record length and you are looking somewhere other than the trigger point, then the digital signal may be off screen. In most of these cases, you can find the digital record by looking for the digital signal in the upper overview and panning accordingly.

**NOTE.** You should turn on MagniVu when light gray shading is displayed to indicate the uncertainty of the edge position. If the shading is not displayed, you do not need to use MagniVu. (See page 93, *Viewing Digital Channels*.)

**Using MagniVu**

1. Push **D15 – D0**.
2. Push MagniVu and select **On**.

<table>
<thead>
<tr>
<th>D15 – D0</th>
<th>Thresholds</th>
<th>Label</th>
<th>MagniVu</th>
<th>Height</th>
</tr>
</thead>
<tbody>
<tr>
<td>On/Off</td>
<td></td>
<td></td>
<td>On</td>
<td>M</td>
</tr>
</tbody>
</table>

**Quick Tips**

- If you think you need more timing resolution, turn on MagniVu to increase the resolution.
- MagniVu is always acquired. If the oscilloscope is in a stopped state, you can turn on MagniVu and still get the resolution without taking another acquisition.
- The serial bus features do not use data acquired in MagniVu mode.
Trigger Setup

This section contains concepts and procedures for setting up the oscilloscope to trigger on your signal.

**Triggering Concepts**

**Trigger Event**

The trigger event establishes the time-reference point in the waveform record. All waveform record data is located in time with respect to that point. The instrument continuously acquires and retains enough sample points to fill the pretrigger portion of the waveform record. That is the part of the waveform that is displayed before, or to the left of, the triggering event on screen. When a trigger event occurs, the instrument starts acquiring samples to build the posttrigger portion of the waveform record, that is, the part displayed after or to the right of the trigger event. After a trigger is recognized, the instrument will not accept another trigger until the acquisition is complete and the holdoff time has expired.

![Untriggered display](image1)

![Triggered display](image2)

**Trigger Modes**

The trigger mode determines how the instrument behaves in the absence of a trigger event:

- **Normal trigger mode** enables the instrument to acquire a waveform only when it is triggered. If no trigger occurs, the last waveform record acquired remains on the display. If no last waveform exists, no waveform is displayed.

- **Auto trigger mode** enables the instrument to acquire a waveform even if a trigger does not occur. Auto mode uses a timer that starts when the acquisition is started, and the pretrigger information is obtained. If a trigger event is not detected before the timer times out, the instrument forces a trigger. The length of time it waits for a trigger event depends on the time base setting.

Auto mode, when forcing triggers in the absence of valid triggering events, does not synchronize the waveform on the display. The waveform will appear to roll across the screen. If valid triggers occur, the display will become stable.

You can also force the instrument to trigger by pushing the front-panel **Force Trig** button.
Trigger Holdoff

Adjust holdoff to obtain stable triggering when the instrument is triggering on undesired trigger events.

Trigger holdoff can help stabilize triggering, since the oscilloscope does not recognize new triggers during the holdoff time. When the instrument recognizes a trigger event, it disables the trigger system until acquisition is complete. In addition, the trigger system remains disabled during the holdoff period that follows each acquisition.

Trigger Coupling

Trigger coupling determines what part of the signal is passed to the trigger circuit. Edge triggering can use all available coupling types: DC, AC, Low Frequency Rejection, High Frequency Rejection, and Noise Rejection. Sequence (B) triggering does not provide AC coupling. Other trigger types use DC coupling only.

Horizontal Position

When Delay Mode is on, use horizontal position to acquire waveform detail in a region that is separated from the trigger location by a significant interval of time.
1. Adjust the position (delay) time by rotating the **Horizontal Position** knob.

2. Turn horizontal **SCALE** to acquire the detail that you need around the position (delay) expansion point.

The part of the record that occurs before the trigger is the pretrigger portion. The part that occurs after the trigger is the posttrigger portion. Pretrigger data can help you troubleshoot. For example, to find the cause of an unwanted glitch in your test circuit, you can trigger on the glitch and make the pretrigger period large enough to capture data before the glitch. By analyzing what happens before the glitch, you may uncover information that helps you find the source of the glitch. Alternatively, to see what is happening in your system as a result of the trigger event, make the posttrigger period large enough to capture data after the trigger.

**Slope and Level**

The slope control determines whether the instrument finds the trigger point on the rising or the falling edge of a signal. The level control determines where on that edge the trigger point occurs.

The oscilloscope provides a long horizontal bar or bars across the graticule to temporarily show the trigger level.

1. Turn the front-panel **Trigger Level** knob to adjust the trigger level without going to a menu.

   Push the knob to quickly set the trigger level to the midpoint of the waveform.
Choosing a Trigger Type

To select a trigger:

1. Push Trigger Menu.

2. Push Type to bring up the Trigger Type side-bezel menu.

3. Turn multipurpose knob a to select the desired trigger type.

4. Complete the trigger setup using the lower-bezel menu controls displayed for the trigger type. The controls to set up the trigger vary depending on the trigger type.

### Triggering on Buses

You can use your oscilloscope to trigger on I²C, SPI, RS-232, RS-422, RS-485, UART, CAN, LIN, I²S, Left Justified (LJ), Right Justified (RJ), and TDM buses, if you have the appropriate DPO3AUDIO, DPO3AUTO, DPO3COMP, or DPO3EMBD application module installed. The MSO3000 Series can trigger on parallel buses without an application module. The oscilloscope can display both physical layer (as analog waveforms) and protocol level information (as symbolic waveforms).

To set up the bus trigger:

1. If you have not already defined your bus using the front-panel B1 and B2 buttons, do so now. (See page 54, Setting Up a Serial or Parallel Bus.)

2. Push Trigger Menu.

3. Push Type.

4. Turn multipurpose knob a to scroll through the trigger type side menu until you select Bus.
5. Push **Source Bus** and turn multipurpose knob a to scroll through the source bus side menu until you select the bus that you want to trigger on.

6. Push **Trigger On** and select the desired trigger on feature from the side-bezel menu.
   - If you are using the I2C bus trigger, you can trigger on **Start**, **Repeated Start**, **Stop**, **Missing Ack**, **Address**, **Data**, or **Address/Data**.
   - If you are using the SPI bus trigger, you can trigger on **SS Active**, **MOSI**, **MISO**, or **MOSI & MISO**.
   - If you are using the RS-232 bus trigger, you can trigger on **Tx Start Bit**, **Rx Start Bit**, **Tx End of Packet**, **Rx End of Packet**, **Tx Data**, or **Rx Data**.
   - If you are using the CAN bus trigger, you can trigger on **Start of Frame**, **Type of Frame**, **Identifier**, **Data**, **Id & Data**, **End of Frame**, and **Missing Ack**.
   - If you are using the LIN bus trigger, you can trigger on **Sync**, **Identifier**, **Data**, **Id & Data**, **Wakeup Frame**, **Sleep Frame**, or **Error**.
   - If you are using the I2S, LJ, and RJ bus, you can trigger on **Word Select**, or **Data**.
   - If you are using the TDM bus, you can trigger on **Frame Sync**, or **Data**.

7. If you are setting up an I2C trigger and have made a **Trigger On** selection of **Address** or **Address/Data**, push the lower-bezel **Address** button to access the I2C Address side-bezel menu.
   - Push the side-bezel **Addressing Mode** button and select **7 bit** or **10 bit**. Push the side-bezel **Address** button. Enter the address parameters of interest with multipurpose knobs a and b.
   - Then push the lower-bezel menu **Direction** button and select the direction of interest: **Read**, **Write**, or **Read or Write**.
If you have made a **Trigger On** selection of **Data** or **Address/Data**, push the lower-bezel **Data** button to access the I2C Data side-bezel menu.

Push the **Number of Bytes** button and enter the number of bytes with multipurpose knob a.

Push the side-bezel **Addressing Mode** button and select **7 bit** or **10 bit**. Push the side-bezel **Data** button. Enter the data parameters of interest with multipurpose knobs a and b.

For more information on the I2C address formats, refer to item 2 under **Setting Up Bus Parameters**.

8. If you are setting up an SPI trigger and have made a **Trigger On** selection of **MOSI** or **MISO**, push the lower-bezel **Data** button, push the side-bezel **MOSI** (or **MISO**) button, and enter the data parameters of interest with multipurpose knobs a and b.

Then push the **Number of Bytes** button and enter the number of bytes with multipurpose knob a.

If you select **MOSI & MISO**, push the lower-bezel **Data** button and enter the parameters of interest in the side-bezel menus.

9. If you are setting up an RS-232 trigger and have made a **Trigger On** selection of **Tx Data** or **Rx Data**, push the lower-bezel **Data** button.

Push the **Number of Bytes** button and enter the number of bytes with multipurpose knob a.

Push the side-bezel **Data** button, and enter the parameters of interest with multipurpose knobs a and b.
10. If you are setting up a CAN trigger and have made a **Trigger On** selection of **Type of Frame**, push the lower-bezel **Frame Type** button, and select Data Frame, Remote Frame, Error Frame, or Overload Frame.

If you have made a **Trigger On** selection of **Identifier**, push the lower-bezel **Identifier** button, and select a **Format**. Then push the **Identifier** side-bezel button, and enter a binary or hex value with multipurpose knobs a and b.

Push the lower-bezel menu **Direction** button and select the direction of interest: **Read**, **Write**, or **Read or Write**.

If you have made a **Trigger On** selection of **Data**, push the lower-bezel **Data** button and enter the parameters of interest with multipurpose knobs a and b.

11. If you are setting up an LIN trigger and have made a **Trigger On** selection of **Identifier**, **Data**, or **Identifier & Data**, push the lower-bezel **Identifier** or **Data** buttons and enter the parameters of interest on the resulting side-bezel menu.

If you have made a **Trigger On** selection of **Error**, push the lower-bezel **Error Type** button and enter the parameters of interest on the resulting side-bezel menu.

12. If you are using the I²S, Left Justified (LJ) or Right Justified (RJ) bus, you can trigger on **Word Select** or **Data**.

If you have made a **Trigger On** selection of **Data**, push the lower-bezel **Data** button and enter the parameters of interest with multipurpose knobs a and b.

13. If you are using the TDM bus, you can trigger on **Frame Sync** or **Data**.
**I2C, SPI, CAN, and LIN Bus Trigger Data Matching**

**Rolling window byte matching for I2C and SPI.** To use a rolling window to trigger on data, you define the number of bytes to match. Then the oscilloscope uses a rolling window to find any match within a packet, with the window rolling one byte at a time.

For example, if the number of bytes is one, the oscilloscope will attempt to match the first byte, second byte, third, and so on within the packet.

If the number of bytes is two, the oscilloscope will try to match any two consecutive bytes, such as one and two, two and three, three and four, and so on. If the oscilloscope finds a match, it will trigger.

**Specific byte matching (non-rolling window matching for a specific position in the packet) for I2C, SPI, CAN, and LIN.** You can trigger on a specific byte for I2C, SPI, CAN, and LIN in several ways:

- For I2C and SPI, enter the number of bytes to match the number of bytes in the signal. Then use don’t cares (X) to mask the bytes that you are not interested in.
- For I2C, push the lower-bezel Trigger On to trigger on Address/Data. Push Address. On the side-bezel menu, push Address, and rotate multipurpose knobs a and b as needed. Set the address to don’t cares (X) if you want to mask the address. The data will be matched starting at the first byte without using a rolling window.
- For CAN and LIN, triggering occurs when the user-selected data input matches the data and qualifier in the signal starting at the first byte. Set the number of bytes to match thenumber of bytes of interest. Use the data qualifier to perform: =, !=, <, >, >=, and <= operations. Triggering on identifier and data always matches the identifier and data selected by the user, with the data starting at the first byte. No rolling window is used.

**RS-232 Bus Trigger Data Matching**

You can trigger on a specific data value for RS-232 bytes. If you defined an end-of-packet character to use for RS-232 bus decoding, you can use the same end-of-packet character as a data value for trigger data matching. To do so, choose the Tx End of Packet or the Rx End of Packet character as the Trigger On selection.

**Parallel Bus Trigger Data Matching**

Optimum parallel bus trigger performance is achieved by using only analog channels or only digital channels (MSO3000 Series only).

**Checking Trigger Settings**

To quickly determine the settings of some key trigger parameters, check the Trigger readout at the bottom of the display. The readouts differ for edge and the advanced triggers.

1. Trigger source = channel 1.
2. Trigger slope = rising.
3. Trigger level = 0.00 V.

![Edge trigger readout](image)
Using Sequence Trigger, A (Main) and B (Delayed)

Combine an edge A Event (Main) trigger with the B Event (Delayed) trigger to capture more complex signals. After the A Event occurs, the trigger system looks for the B Event before triggering and displaying the waveform.

A and B triggers can (and typically do) have separate sources.

Use the Edge trigger menu to set up the A trigger first. Then, to use the B trigger:

1. Push Trigger Menu.

2. Push Type.

3. Turn multipurpose knob a to select a trigger type of Sequence (B Trigger).
   
   This brings up the Sequence (B Trigger) menu.

4. Push B Trigger After A.
Push a side-bezel button to select sequencing the B trigger after the A as Time or as Events.

5. Set the other Sequence Trigger parameters in the related side- and lower-bezel menus.

**B Trigger After Delay Time**

The A trigger arms the instrument. Posttrigger acquisition starts on the first B edge after the trigger delay time.

**Trigger on B Events**

The A trigger arms the instrument. Posttrigger acquisition starts on the nth B event.

**Quick Tips**

- B-trigger delay time and horizontal position are independent functions. When you establish a trigger condition using either the A trigger alone or the A and B triggers together, you can also use the horizontal position control to delay the acquisition by an additional amount.
- When using the B trigger, the A and B trigger types can only be Edge.
Starting and Stopping an Acquisition

After you have defined the acquisition and trigger parameters, start the acquisition with Run/Stop or Single.

- Push Run/Stop to start acquisitions. The oscilloscope acquires repeatedly until you push the button again to stop the acquisition.

- Push Single to take a single acquisition. Single sets the trigger mode to Normal for the single acquisition.
Display Waveform Data

This section contains concepts and procedures for displaying the acquired waveform.

Adding and Removing a Waveform

1. To add or remove a waveform from the display, push the corresponding front-panel channel button or the D15-D0 button.

You can use the channel as a trigger source whether or not it is displayed.

Setting the Display Style and Persistence

1. To set the display style, push Acquire.

2. Push Waveform Display.
3. Push **Dots Only** from the side-bezel menu. Dots on will display the waveform record points as dots on the screen. Dots off connects the dots with vectors.

4. Push **Persist Time**, and turn multipurpose knob a to have waveform data remain on screen for a user-specified amount of time.

5. Push **Set to Auto** to have the oscilloscope automatically determine a persistence time for you.

6. Push **Clear Persistence** to reset the persistence information.

7. To display the amplitude from one waveform against the amplitude from another, push **XY Display**. Then push **Triggered XY** from the side menu.

A data point from the first waveform specifies the horizontal location while the corresponding data point from the second waveform specifies the vertical location for each displayed point.

### Quick Tips

- Variable persistence accumulates record points for a specified time interval. Each record point decays independently according to the time interval. Use variable persistence for displaying infrequently appearing signal anomalies, such as glitches.

- Infinite persistence continuously accumulates record points until you change one of the acquisition display settings. Use infinite persistence for displaying unique signal anomalies, such as glitches.

- The XY Display mode graphs the data in fixed pairs of waveforms against one another. You can use CH1 versus CH2, and REF1 versus REF2. On four-channel models, you can also use CH3 versus CH4, and REF3 versus REF4.

- When the XY Display is on, an upper window appears that displays data versus time.

### Setting the Graticule Style

1. To set the graticule style, push **Utility**.
2. Push **Utility Page**.

3. Turn multipurpose knob **a** and select **Display**.

4. Push **Graticule** from the lower-bezel menu.
5. Select the desired style from the resulting side-bezel menu.
   Use the **Full** graticule for quick estimates of waveform parameters.
   Use the **Grid** graticule for full-screen measurements with cursors and automatic readouts when cross hairs are not needed.
   Use the **Cross Hair** graticule for making quick estimates of waveforms while leaving more room for automatic readouts and other data.
   Use the **Frame** graticule with automatic readouts and other screen text when display features are not needed.

**Quick Tips**

- You can display IRE and mV graticules. To do this, set the trigger type to video and set the vertical scale to 143 mV/division. (The 143 mV/division selection is available in the coarse vertical scale settings for the channel when you set the trigger type to video.) The oscilloscope will automatically display the IRE graticule for NTSC signals, and the mV graticule for other video signals (PAL, SECAM, HDTV, and custom).

**Setting the LCD Backlight**

1. Push **Utility**.

2. Push **Utility Page**.

3. Turn multipurpose knob a and select **Display**.
4. Push **Backlight Intensity**.

5. Select the intensity level from the resulting side-bezel menu. Choices are: **High**, **Medium**, and **Low**.

### Setting Waveform Intensity

1. Push the front-panel **Intensity** button.

   This will bring up the intensity readout on the display.

2. Rotate multipurpose knob **a** to select the desired waveform intensity.

3. Rotate multipurpose knob **b** to select the desired intensity for the graticule.

4. Push **Intensity** again to clear the intensity readout from the display.
Scaling and Positioning a Waveform

Use the horizontal controls to adjust the time base, adjust the trigger point, and to examine waveform details more closely. You can also use the Wave Inspector Pan and Zoom controls to adjust the display of waveforms. (See page 114, *Using Wave Inspector to Manage Long Record Length Waveforms.*)

Use the vertical controls to select waveforms, adjust the waveform vertical position and scale, and set input parameters. Push a channel menu button (1, 2, 3, or 4) as many times as needed and the associated menu items to select, add, or remove a waveform.

Quick Tips

- **Preview.** If you change the Position or Scale controls when the acquisition is stopped or when it is waiting for the next trigger, the oscilloscope rescales and repositions the relevant waveforms in response to the new control settings. It simulates what you will see when you next push the **RUN** button. The oscilloscope uses the new settings for the next acquisition.

  You may see a clipped waveform if the original acquisition went off the screen.

  The math waveform, cursors, and automatic measurements remain active and valid when using preview.
Setting Input Parameters

Use the vertical controls to select waveforms, adjust the waveform vertical position and scale, and set input parameters.

1. Push a channel menu button 1, 2, 3, or 4 to bring up the vertical menu for the designated waveform. The vertical menu only affects the selected waveform.

   Pushing a channel button will also select or cancel that waveform selection.

2. Push **Coupling** repeatedly to select the coupling to use.
   Use DC coupling to pass both AC and DC components.
   Use AC coupling to block the DC component and show only the AC signal.
   Use Ground (GND) to display the reference potential.

3. Push **Impedance** repeatedly to select the input impedance to use.
   Set the input impedance (termination) to 50 Ω, 75 Ω, or 1 MΩ if using DC or Gnd coupling. Input impedance is automatically set to 1 MΩ when using AC coupling.
   For more information on input impedance, see **Quick Tips**. (See page 90, **Quick Tips**.)

4. Push **Invert** to invert the signal.
   Select **Off** for normal operation and **On** to invert the polarity of the signal in the preamplifier.

5. Push **Bandwidth**, and select the desired bandwidth from the resulting side-bezel menu.
   The set choices are: Full and 20 MHz. Additional choices may appear, depending on the probe that you use.
   Select **Full** to set the bandwidth to the full oscilloscope bandwidth.
   Select **20 MHz** to set the bandwidth to 20 MHz.

6. Push **Label** to create a label for the channel.
   (See page 45, **Labeling Channels and Buses**.)
7. Push **More** to access additional side-bezel menus.

8. Select **Fine Scale** to enable multipurpose knob a to make fine vertical scale adjustments.

   

   8. **Fine Scale**

   9. **Offset**

   10. **Probe Setup**

   11. **Deskew**

9. Select **Offset** to enable multipurpose knob a to make vertical offset adjustments.

   On the side-bezel menu, choose **Set to 0 V** to set the vertical offset to 0 V.

   For more information on offset, see **Quick Tips**. (See page 90, **Quick Tips**.)

10. Select **Probe Setup** to define probe parameters.

    On the resulting side-bezel menu:

    - Select **Voltage** or **Current** to set the probe type for probes that do not have the TekProbe Level 1, TekProbe II (requires a TPA-BNC adapter) or TekVPI interface.

    - For probes that do not have a Tek interface, when **Probe Type** is set to **Voltage**, use multipurpose knob a to set the **Attenuation** to match the probe.

    - For probes that do not have a Tek interface, when **Probe Type** is set to **Current**, use multipurpose knob a to set the Amps/Volts ratio (**Attenuation**) to match the probe.
If you are measuring current by probing the voltage drop across a resistor, set Measure Current to Yes. Push the A/V ratio side-bezel button and turn multipurpose knob a to set the Amps/Volts or Volts/Amps ratio of your setup. For example, if you are measuring the drop across a 2 Ohm resistor, set the V/A ratio to 2.

11. Select Deskew to make display and measurement adjustments for probes that have differing propagation delays. This is especially important when using a current probe in conjunction with a voltage probe. For best results, use a deskew fixture, such as the Tektronix 067-1686-xx.

If you do not have a deskew fixture, you can use the controls in the Deskew menu to set the oscilloscope’s deskew parameters to recommended values, based on the normal propagation delay of each probe. The oscilloscope automatically loads the nominal propagation delay values of TekVPI and TekProbe II (requires use of a TPA-BNC adapter) probes. For other common probes, first push the side-bezel Select button, and select the channel to which the probe is attached. Then push the side-bezel Probe Model button, and select the probe model. If your probe is not in the list, set the probe model to Other, and push the side-bezel Propagation Delay button and dial in its propagation delay with multipurpose knob a.
To display the recommended deskew values calculated by the oscilloscope, set the side-bezel **Show rec. deskews** to **Yes**.

To set the deskew value of each channel to the recommended value, push the side-bezel **Set all deskews to recommended value** button.

**Quick Tips**

- **Using Probes with the TekProbe II and TekVPI Interfaces.** When you attach a probe with the TekProbe II or the TekVPI interface, the oscilloscope sets the channel sensitivity, coupling, and termination resistance automatically to match the probe requirements. Tek Probe II probes require use of the TPA-BNC Adapter.

- **The Difference Between Vertical Position and Offset.** Adjust the vertical position to place the waveforms where you want to see them. The waveform baseline indicators indicate the zero Volts (or Amps) level for each waveform. If you adjust the channel’s Vertical Scale, the waveform expands or contracts around the waveform’s baseline indicator.

  When you use the Channel<-> More > Offset > Vertical Offset control to move a waveform, the baseline indicator no longer represents zero. Instead, it represents the level of the offset. If you adjust the channel’s Vertical Scale, the waveform expands or contracts around the waveform’s baseline indicator.

- **50 and 75 Ω Protection.** If you select 50 Ω or 75 Ω termination, the maximum vertical scale factor is limited to 1 V/div, except that with a 10X probe the scale factor is 10 V. If you apply excessive input voltage, the oscilloscope automatically switches to 1 MΩ termination to protect the internal 50 Ω or 75 Ω termination. For more details, refer to the specifications in the DPO3000 Series Oscilloscopes Technical Reference.

**Positioning and Labeling Bus Signals**

- **Positioning bus signals.** Push the appropriate front-panel bus button and turn multipurpose knob a to adjust the vertical position of the selected bus. (See page 54, Setting Up a Serial or Parallel Bus.)

  1. Push the appropriate front-panel bus button to select that bus.

  2. Turn multipurpose knob a to adjust the vertical position of the selected bus.
Labeling bus signals. To label a bus, do the following steps:

1. Push the appropriate front-panel bus button.

2. Push Label.

Positioning, Scaling, and Grouping Digital Channels

1. Push the front-panel D15–D0 button.

2. Push the lower-bezel D15–D0 menu item.

3. Push the side-bezel Select button.
4. Turn multipurpose knob a to select the channel to move.

5. Turn multipurpose knob b to move the selected channel.

**NOTE.** The display of the channel (or group) only moves after you stop rotating the knob.

6. To change the scale (height) of the digital channels, push the lower-menu **Height** button.

**NOTE.** The S (Small) selection will display each waveform at 0.2 divisions tall. The M (Medium) selection will display each waveform at 0.5 divisions tall. The L (Large) selection will display each waveform at 1 division tall. L only works if there is enough room in the display to display the waveforms. You can display up to 8L waveforms at one time.

7. You can label individual digital channels for easier identification. (See page 45, Labeling Channels and Buses.)

8. To group some or all of the digital channels together, move the channels right next to each other. All the channels that are next to each other automatically form a group.

You can see the groups by pressing the side-bezel **Select** item and turning multipurpose knob a.

When a group is selected, turn multipurpose knob b to move the whole group.
Viewing Digital Channels

The various ways of displaying data from the digital channels help you analyze the signals. Digital channels store a high or low state for each sample.

Logic high levels are displayed in green. Logic low levels are displayed in blue. When a single transition occurs during the time represented by one pixel column, the transition (edge) is displayed in gray.

When multiple transitions occur during the time represented by one pixel column, the transition (edge) is displayed in white.

When the display shows a white edge, indicating multiple transitions, you may be able to zoom in and see the individual edges.

When the oscilloscope is zoomed in so far that there is more than one pixel column per sample, the uncertainty of the edge position is indicated by light gray shading.

NOTE. When the light gray shading is displayed, use MagniVu. The MagniVu readout appears when MagniVu is being used.

Annotating the Screen

You can add your own text to the screen by doing the following:

1. Push Utility.

3. Turn multipurpose knob a and select Display.

4. Push Screen Annotation from the resulting lower-bezel menu.

5. Push Display Annotation to select On from the side-bezel menu.
   The annotation window now appears.
   Position it by turning multipurpose knobs a and b.

6. Push Edit Annotation from the side-bezel menu

7. Turn multipurpose knob a to scroll through the list of letters, numbers, and other characters to select each desired character.
   Alternatively, use a US-style USB keyboard to type in characters. (See page 27, Connecting a USB Keyboard to Your Oscilloscope.)

   To reposition the annotated text, press the side-bezel Position button and turn multipurpose knobs a and b, as desired.

---

**Viewing the Trigger Frequency**

You can display a readout of trigger frequency. It counts all of the triggerable events, whether the oscilloscope triggered on them or not, and displays the number of times per second that they occur. To display this readout, do the following:

1. Push Utility.

3. Turn multipurpose knob a and select Display.

4. Push Trigger Frequency Readout from the resulting lower-bezel menu.

5. Push On from the side-bezel menu.

The trigger frequency now appears in the Trigger readout, towards the lower right of the display.
Analyze Waveform Data

After having properly set up the acquisition, triggering, and display of your desired waveform, you can then analyze the results. Select from features such as cursors, automatic measurements, statistics, math, and FFT.

Taking Automatic Measurements

To take an automatic measurement:

1. Push **Measure**.

2. Push **Add Measurement**.

3. Turn multipurpose knob **a** to select the specific measurement. If needed, then turn multipurpose knob **b** to select the channel to measure on.

4. To remove a measurement, push **Remove Measurement**, turn multipurpose knob **a** to select the specific measurement, and push **OK Remove Measurement** on the side-bezel menu.

Quick Tips

- To remove all measurements, select **Remove All Measurements**.
- A ▶ symbol appears instead of the expected numerical measurement if a vertical clipping condition exists. Part of the waveform is above or below the display. To obtain a proper numerical measurement, turn the vertical scale and position knobs to make all of the waveform appear in the display.
## Selecting Automatic Measurements

The following tables list each automatic measurement by category: time or amplitude. (See page 96, Taking Automatic Measurements.)

### Time Measurements

<table>
<thead>
<tr>
<th>Measurement</th>
<th>Description</th>

Customizing an Automatic Measurement

You can customize automatic measurements by using gating, modifying measurement statistics, adjusting the measurement reference levels, or taking a snapshot.

Gating

Gating confines the measurement to a certain portion of a waveform. To use:

1. Push Measure.

2. Push More as many times as needed to select Gating from the resulting pop-up menu.

3. Position the gates from the side-bezel menu options.
Statistics

Statistics characterize the stability of measurements. To adjust statistics:

1. Push Measure.

2. Push More as many times as needed to select Statistics from the resulting pop-up menu.

3. Push the side-bezel menu options. These include whether to turn statistics on or off and how many samples to use for mean and standard deviation calculations.

Snapshot

To see all the single-sourced measurements at one moment in time:

1. Push Measure.

2. Push Add Measurement as many times as needed to select Statistics from the resulting pop-up menu.
3. Turn multipurpose knob a to select the Measurement Type of Snapshot.

4. Push OK Snapshot All Measurements.

5. View results.

Reference Levels

Reference levels determine how time-related measurements are taken. For example, they are used in calculating rise and fall times.

1. Push Measure.
2. Push More as many times as needed to select Reference Levels from the resulting pop-up menu.

3. Set the levels from the side-bezel menu.

Use High and Low reference to calculate rise and fall times.

Use Mid reference primarily for measurements between edges, such as pulse widths.

Taking Manual Measurements with Cursors

Cursors are on-screen markers that you position in the waveform display to take manual measurements on acquired data. They appear as horizontal and/or as vertical lines. To use cursors:

1. Push Cursors.

   This changes the cursor state. The three states are:
   - No cursors appear on the screen.
   - Two vertical waveform cursors appear. They are attached to the selected waveform.
   - Four screen cursors appear. Two are vertical and two are horizontal. They are no longer specifically attached to a waveform.

   For example, the first time you push Cursors, the state might be off.
2. Push **Cursors** again.
   In the example, two vertical cursors appear on the selected screen waveform. As you turn multipurpose knob \( a \), you move one cursor to the right or left. As you turn knob \( b \), you move the other cursor.
   If you change the selected waveform by pushing the front-panel 1, 2, 3, 4, M, or R button, both cursors jump to the new selected waveform.

3. Push **Select**.
   This turns the cursor linking on and off. If linking is on, turning multipurpose knob \( a \) moves the two cursors together. Turning multipurpose knob \( b \) adjusts the time between the cursors.

4. Push **Fine** to toggle between a coarse and a fine adjustment for multipurpose knobs \( a \) and \( b \).
   Pushing **Fine** also changes the sensitivity of other knobs as well.

5. Push **Cursors** again.
   This will put the cursors into screen mode. Two horizontal bars and two vertical bars span the graticule.

6. Turn multipurpose knobs \( a \) and \( b \) to move the pair of horizontal cursors.
7. Push **Select**.
   This makes the horizontal cursors active and the vertical ones inactive. Now, as you turn the multipurpose knobs, the horizontal cursors will move.
   Push **Select** again to make the vertical cursors active again.

8. View the cursor and the cursor readout.
   You can take timing measurements with cursors on digital channels, but not amplitude measurements.
9. Push **Cursors** again. This will turn off the cursor mode. The screen will no longer display the cursors and the cursor readout.

### Using Cursor Readouts

Cursor readouts supply textual and numeric information relating to the current cursor positions. The oscilloscope always shows the readouts when the cursors are turned on.

Readouts appear in the upper right corner of the graticule. If Zoom is on, the readout appears in the upper right corner of the zoom window.

When a bus is selected, the readout shows the decoded bus data in the format you have selected, hexadecimal, binary, decimal, or ASCII (depending on the selected standard). The data value of that point is displayed in the cursor readout.

**Δ Readout:**

The Δ readouts indicate the difference between the cursor positions.

- **a Readout:** Indicates that the value is controlled by multipurpose knob a.
- **b Readout:** Indicates that the value is controlled by multipurpose knob b.

The horizontal cursor lines on the display measure the vertical parameters, typically voltage.
The vertical cursor lines on the display measure horizontal parameters, typically time.

The square and circle shapes in the readout map to the multipurpose knobs when both vertical and horizontal cursors are present.

**Using XY Cursors**

When the XY Display mode is on, the cursor readouts will appear to the right of the graticule. They include rectangular, polar, product, and ratio readouts.

**Using Math Waveforms**

Create math waveforms to support the analysis of your channel and reference waveforms. By combining and transforming source waveforms and other data into math waveforms, you can derive the data view that your application requires.

*NOTE.* Math waveforms are not available for use with serial buses.
Use the following procedure for executing simple (+, −, ×, ÷) math operations on two waveforms:

1. Push **Math**.

2. Push **Dual Wfm Math**.

3. On the side-bezel menu, set the sources to either channel 1, 2, 3, 4, or reference waveforms R1, R2, R3, or R4. Choose the +, −, ×, or ÷ operators.

4. For example, you might calculate power by multiplying a voltage waveform and a current waveform.

**Quick Tips**
- Math waveforms can be created from channel or reference waveforms or a combination of them.
- Measurements can be taken on math waveforms in the same way as on channel waveforms.
- Math waveforms derive their horizontal scale and position from the sources in their math expressions. Adjusting these controls for the source waveforms also adjusts the math waveform.
- You can zoom in on math waveforms using the inner knob of the Pan-Zoom control. Use the outer knob for positioning the zoomed area. (See page 114, *Using Wave Inspector to Manage Long Record Length Waveforms.*)
Using FFT

An FFT breaks down signals into component frequencies, which the oscilloscope uses to display a graph of the frequency domain of a signal, as opposed to the oscilloscope’s standard time domain graph. You can match these frequencies with known system frequencies, such as system clocks, oscillators, or power supplies.

2. Push FFT.

3. Push the side-bezel menu FFT Source button, if needed, and turn multipurpose knob a to select the source to use. Choices are: channels 1, 2, 3, 4, reference waveforms R1, R2, R3, and R4.

4. Push the side-bezel Vertical Scale button repeatedly to select either Linear RMS or dBV RMS.

5. Push the side-bezel Window button repeatedly to select the desired window. Window choices are: Rectangular, Hamming, Hanning, and Blackman-Harris.

6. Push the side-bezel Horizontal button to activate multipurpose knobs a and b to pan and zoom the FFT display.
Analyze Waveform Data

7. The FFT will appear on the display.

Quick Tips

- Use short record lengths for faster instrument response.
- Use long record lengths to lower the noise relative to the signal and increase the frequency resolution.
- If desired, use the zoom feature along with the horizontal Position and Scale controls to magnify and position the FFT waveform.
- Use the default dBV RMS scale to see a detailed view of multiple frequencies, even if they have very different amplitudes. Use the linear RMS scale to see an overall view of how all frequencies compare to each other.
- The FFT feature provides four windows. Each is a trade-off between frequency resolution and magnitude accuracy. What you want to measure and your source signal characteristics help determine which window to use. Use the following guidelines to select the best window.

<table>
<thead>
<tr>
<th>Description</th>
<th>Window</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rectangular</td>
<td><img src="image1.png" alt="Rectangular Window" /></td>
</tr>
<tr>
<td>This is the best type of window for resolving frequencies that are very close to the same value but worst for accurately measuring the amplitude of those frequencies. It is the best type for measuring the frequency spectrum of nonrepetitive signals and measuring frequency components near DC. Use Rectangular for measuring transients or bursts where the signal level before and after the event are nearly equal. Also, use this window for equal-amplitude sine waves with frequencies that are very close and for broadband random noise with a relatively slow varying spectrum.</td>
<td></td>
</tr>
<tr>
<td>Hamming</td>
<td><img src="image2.png" alt="Hamming Window" /></td>
</tr>
<tr>
<td>This is a very good window for resolving frequencies that are very close to the same value with somewhat improved amplitude accuracy over the rectangular window. It has a slightly better frequency resolution than the Hanning. Use Hamming for measuring sine, periodic, and narrow band random noise. This window works on transients or bursts where the signal levels before and after the event are significantly different.</td>
<td></td>
</tr>
</tbody>
</table>
### Description Window

**Hanning**
This is a very good window for measuring amplitude accuracy but less so for resolving frequencies.

Use Hanning for measuring sine, periodic, and narrow band random noise. This window works on transients or bursts where the signal levels before and after the event are significantly different.

**Blackman-Harris**:
This is the best window for measuring the amplitude of frequencies but worst at resolving frequencies.

Use Blackman-Harris for measuring predominantly single frequency waveforms to look for higher order harmonics.

### Using Advanced Math

The advanced math feature lets you create a custom math waveform expression that can incorporate active and reference waveforms, measurements, and/or numeric constants. To use this feature:

1. Push **Math**.

2. Push **Advanced Math**.

3. Use the side-bezel menu buttons to create custom expressions.

4. Push **Edit Expression** and use the multipurpose knobs and the resulting lower-bezel buttons to create an expression. When done, push the side-bezel menu **OK Accept** button.
Analyze Waveform Data

For example, to use **Edit Expression** to take the integral of a square wave:

1. Push the lower-bezel **Clear** button.
2. Turn multipurpose knob a to select **Intg(**.
3. Push **Enter Selection**.
4. Turn multipurpose knob a to select channel **1**.
5. Push **Enter Selection**.
6. Turn multipurpose knob a to select ).
7. Push **OK Accept**.

### Using Reference Waveforms

Create a reference waveform to store a waveform. For example, you might do this to set up a standard against which to compare other waveforms. To use the reference waveforms:

**NOTE.** 5 M reference waveforms are volatile and not saved when the oscilloscope power is turned off. To keep these waveforms, save them to external storage.

1. Push **Ref R**. This brings up the lower-bezel reference menu.

2. Use the resulting lower-bezel menu selections to display or select a reference waveform.
3. Use the side-bezel menu and the multipurpose knobs to adjust the vertical and horizontal settings of the reference waveform.

Quick Tips

- **Selecting and Displaying Reference Waveforms.** You can display all the reference waveforms at the same time. Push the appropriate screen button to select a particular reference waveform.

- **Removing Reference Waveforms from the Display.** To remove a reference waveform from the display, push the front-panel R button to access the lower-bezel menu. Then push the associated button from the lower-bezel menu to turn it off.

- **Scaling and Positioning a Reference Waveform.** You can position and scale a reference waveform independently from all other displayed waveforms. Select the reference waveform and then adjust it with a multipurpose knob. You can do this whether acquisition is running or not.

  If a reference waveform is selected, scaling and repositioning of the reference waveform operates the same way whether zoom is turned on or off.

- **Saving 5 M Reference Waveforms.** 5 M reference waveforms are volatile and not saved when the oscilloscope power is turned off. To keep these waveforms, save them to external storage.
Using Wave Inspector to Manage Long Record Length Waveforms

The Wave Inspector controls (zoom/pan, play/pause, marks, search) help you to efficiently work with long record length waveforms. To magnify a waveform horizontally, turn the Zoom knob. To scroll through a zoomed waveform, turn the Pan knob.

The Pan-Zoom Control consists of:

1. An outer pan knob
2. An inner zoom knob

Zooming a Waveform

To use zoom:

1. Rotate the inner knob on the Pan-Zoom control clockwise to zoom in on a selected portion of the waveform. Rotate the knob counterclockwise to zoom back out.

2. Alternatively, enable or disable the zoom mode by pushing the zoom button.
3. Examine the zoomed view of the waveform that appears on the larger, lower portion of the display. The upper portion of the display will show the position and size of the zoomed portion in the waveform, within the context of the overall record.

Panning a Waveform

While the zoom feature is on, you can use the pan feature to quickly scroll through the waveform. To use pan:

1. Rotate the pan (outer) knob of the pan-zoom controls to pan the waveform.
   Turn the knob clockwise to pan forward. Turn it counterclockwise to pan backwards. The further you turn the knob, the faster the zoom window pans.

Playing and Pausing a Waveform

Use the play-pause feature to automatically pan through a waveform record. To use it:

1. Enable the play-pause mode by pushing the play-pause button.
2. Adjust the play speed by turning the pan (outer) knob further. The further you turn it, the faster it goes.
3. Change the play direction by reversing the direction that you are turning the pan knob.

4. During play, up to a point, the more you turn the ring, the faster the waveform accelerates. If you rotate the ring as far as it can go, the play speed does not change, but the zoom box quickly moves in that direction. Use this maximum rotation feature to replay a portion of the waveform that you just saw and want to see again.

5. Pause the play-pause feature by pushing the play-pause button again.

Searching and Marking Waveforms

You can mark locations of interest in the acquired waveform. These marks help you limit your analysis to particular regions of the waveform. You can mark areas of the waveform automatically, if they meet some special criteria, or you can manually mark each item of interest. You can use arrow keys to jump from mark to mark (area of interest to area of interest). You can automatically search and mark many of the same parameters that you can trigger on.

Search marks provide a way to mark a waveform region for reference. You can set marks automatically with search criteria. You can search for and mark regions with particular edges, pulse widths, runts, logic states, rise/fall times, setup and hold, and bus search types.
To manually set and clear (delete) marks:

1. Move (the zoom box) to the area on the waveform where you want to set (or clear) a search mark by turning the pan (outer) knob. Push the next (→) or previous (←) arrow button to jump to an existing mark.

2. Push Set/Clear. If no search mark is at the screen center, the oscilloscope will add one.

3. Investigate your waveform by moving from search mark to search mark. Use the next (→) or previous (←) arrow button to jump from one marked location to another, without adjusting any other controls.

4. Delete a mark. Push the next (→) or previous (←) arrow button to jump to the mark you want to clear. To remove the current, center-positioned mark, push Set/Clear. It works on both manually and automatically created marks.

To automatically set and clear (delete) search marks:

1. Push Search.

2. Select the search type desired from the lower-bezel menu. The search menu is similar to the trigger menu.

3. From the side-bezel menu, turn on the search.
4. On the screen, hollow triangles show the location of automatic marks and solid triangles show the custom (user-defined) locations. These appear on both normal and zoomed waveform views.

5. You can quickly investigate your waveform by moving from search mark to search mark with the next (→) and previous (←) arrow buttons. No other adjustments are needed.

Quick Tips.

- You can copy trigger settings to search for other locations in your acquired waveform that meet the trigger conditions.
- You can also copy search settings to your trigger.
- Custom (User) marks are saved with the waveform when the waveform is saved and when the setup is saved.
- Automatic search marks are not saved with the waveform when the waveform is saved. However, you can easily recapture them by reusing the search function.
- The search criteria are saved in the saved setup.

The Wave Inspector includes the following search capabilities:

<table>
<thead>
<tr>
<th>Search</th>

### Analyzing Power

Acquire, measure, and analyze power signals with the DPO3PWR Power Analysis Module. To use this application:

1. Push **Test**.

2. Push **Analysis**.

3. Use the side-bezel buttons to select the desired analysis function.  
Choose among power quality, switching loss, harmonics, ripple, modulation, and safe operating area, and deskew.
Save and Recall Information

The oscilloscope provides permanent storage for setups, waveforms, and screen images. Use the internal storage of the oscilloscope to save setup files and reference waveform data.

Use external USB flash drives, to save setups, waveforms, and screen images. Use the external storage to carry data to remote computers for further analysis and for archiving.

**External file structure.** If you are saving information to external storage, select the appropriate menu (such as the **To File** side-bezel menu to save setups and waveforms) and turn multipurpose knob a to scroll through the external file structure.

- E: is the USB flash drive plugged into the USB port on the front of the oscilloscope
- F: is the USB flash drive plugged into the USB port on the rear of the oscilloscope

Use multipurpose knob a to scroll through the list of files. Use the Select front panel button to open and close folders.

**Naming your file.** The oscilloscope gives all files it creates a default name in the following format:

- tekXXXXX.set for setup files where XXXXX is an integer from 00000 to 99999
- tekXXXXX.png, tekXXXXX.bmp, or tekXXXXX.tif for image files
- tekXXXXXYY.csv for spreadsheet files or tekXXXXYYY.isf for internal format files

For waveforms, the XXXX is an integer from 0000 to 9999. The YYY is the channel of the waveform, and can be one of the following:

- CH1, CH2, CH3, or CH4 for the analog channels
- D00, D01, D02, D03, and so on through D15 for the digital channels
- MTH for a math waveform
- RF1, RF2, RF3, or RF4 for reference memory waveforms
- ALL for a single spreadsheet file containing multiple channels when you select Save All Waveforms

**NOTE.** Only analog channels and waveforms derived from analog channels (such as math and reference) can be saved to an ISF file. When saving all channels in ISF format, a group of files will be saved. Each will have the same value for XXXX, but the YYY values will be set to the different channels that were turned on when the Save All Waveforms was performed.

For example, the first time you save a file, that file is named tek00000. The next time you save the same type of file, the file will be named tek00001.

**Editing file, directory, reference waveform, or instrument setup names.** Give files descriptive names that you can recognize at a later date. To edit file names, directory names, reference waveform and instrument setup labels:

1. Push **Save / Recall Menu**.
2. Push **Save Screen Image**, **Save Waveform**, or **Save Setup**.

3. For waveform or setup files, enter the file manager by pushing the side-bezel menu **To File** item.

4. Turn multipurpose knob **a** to scroll through the file structure. (See page 120, *External file structure*.)

5. Push **Select** to open or close file folders.

6. Push **Edit File Name**.
   Edit the file name the same way you edit labels for channels. (See page 45, *Labeling Channels and Buses*.)

7. Push the **Menu Off** button to cancel the save operation, or push a side-bezel menu **OK Save** item to complete the operation.
Saving a Screen Image

A screen image consists of a graphical image of the oscilloscope screen. This is different from waveform data, which consists of numeric values for each point in the waveform. To save a screen image:

1. Push **Save / Recall Menu**.
   Do not yet push the **Save** button.

2. Push **Save Screen Image** from the lower-bezel menu.
3. From the side-bezel menu, push **File Format** repeatedly to select among: .tif, .bmp, and .png formats.

4. Push **Orientation** to select between saving the image in a landscape (horizontal) and a portrait (vertical) orientation.

5. Push **Ink Saver** to turn the **Ink Saver** mode on or off. When on, this mode provides a white background.

6. Push **Edit File Name** to create a custom name for the screen image file. Skip this step to use a default name.

7. Push **OK Save Screen Image** to write the image to the selected media.

For information on printing screen images of waveforms, go to *Printing a Hard Copy*. (See page 128, *Printing a Hard Copy*.)

### Saving and Recalling Waveform Data

Waveform data consists of the numeric values for each point in the waveform. It copies the data, as opposed to a graphical image of the screen. To save the current waveform data or to recall previously stored waveform data:

1. Push **Save / Recall Menu**.
2. Push **Save Waveform** or **Recall Waveform** from the lower-bezel menu.

<table>
<thead>
<tr>
<th>Side-bezel menu button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internal File Format (.ISF)</td>
<td>Sets the oscilloscope to save waveform data from analog channels (and math and reference waveforms derived from analog channels), in internal waveform save file (.isf) format. This format is the fastest to write and creates the smallest-sized file. Use this format if you intend to recall a waveform to reference memory for viewing or measuring. The oscilloscope cannot save digital waveforms in an .isf file format.</td>
</tr>
<tr>
<td>Spreadsheet File Format (.CSV)</td>
<td>Sets the oscilloscope to save waveform data as a comma-separated data file compatible with popular spreadsheet programs. This file cannot be recalled to reference memory.</td>
</tr>
</tbody>
</table>

**NOTE.** The oscilloscope can save digital waveforms to .csv files, not reference memories. The oscilloscope cannot recall digital waveforms.

3. Select one waveform or all waveforms.

4. From the resulting side-bezel menu, select the location to save the waveform data to or to recall it from.

   - Save the information externally to a file on a USB flash drive. Alternatively, save the information internally to one of the two reference memory files on 2-channel model or one of the four reference files on 4-channel model oscilloscopes.

5. Push **File Details** to save to a USB flash drive.

   - This brings up the file manager screen. Use it to define a custom file name. Skip this step to use the default name and location.

**Saving a waveform to file.** When you push the **File Details** side-bezel menu button, the oscilloscope changes the side-bezel menu contents. The following table describes these side-bezel menu items for saving data to a mass storage file.

**Saving an analog waveform to reference memory.** To save an analog waveform to nonvolatile memory inside the oscilloscope, select the waveform that you want to save, push the **Save Waveform** screen button, and then select one of the reference waveform locations. Four-channel models have four reference locations. Two-channel models have two reference locations.

   - Saved waveforms contain only the most recent acquisition. Gray-scale information, if any, is not saved.

**NOTE.** 5 M reference waveforms are volatile and not saved when the oscilloscope power is turned off. To keep these waveforms, save them to external storage.
Displaying a Reference Waveform

To display a waveform stored in nonvolatile memory:

1. Push Ref R.

2. Push R1, R2, R3, or R4.

Removing a reference waveform from the display.

To remove a reference waveform from the display:

1. Push Ref R.

2. Push the R1, R2, R3, or R4 lower-bezel button to remove the reference waveform from the display.

The reference waveform is still in nonvolatile memory and can be displayed again.

Saving and Recalling Setups

Setup information includes acquisition information, such as vertical, horizontal, trigger, cursor, and measurement information. It does not include communications information, such as GPIB addresses. To save the setup information:

1. Push Save / Recall Menu.
2. Push Save Setup or Recall Setup from the lower-bezel menu.

3. From the resulting side-bezel menu, select the location to save the setup to or to recall it from.
   - To save setup information to one of the ten internal setup memories in the oscilloscope, push the appropriate side-bezel button.
   - To save setup information to a USB file, push the To File button.

4. If you are saving information to a USB flash drive, turn multipurpose knob a to scroll through the file structure. (See page 120, External file structure.)

   Push Select to open or close file folders.

   Push the Menu Off button to cancel the save operation, or push a side-bezel menu Save to Selected File item to complete the operation.
Quick Tips

- **Recalling the Default Setup.** Push the front-panel Default Setup button to initialize the oscilloscope to a known setup. (See page 47, Using the Default Setup.)

### Saving with One Button Push

After you have defined the save/recall parameters with the Save/Recall Menu button and menu, you can save files with a single push of the **Save** button. For example, if you have defined the save operation to save waveform data to a USB drive, then each push of the **Save** button will save current waveform data to the defined USB drive.

1. To define the **Save** button behavior, push **Save/Recall Menu**.

2. Push **Assign Save to** button.

3. Push the action to assign to the **Save** button.

4. From now on, when you push **Save** the oscilloscope will perform the action that you just specified rather than requiring you to navigate through the menus each time.
Printing a Hard Copy

To print an image of what appears on the oscilloscope screen, do the following procedure.

Connect a Printer to Your Oscilloscope

Connect a non-PictBridge printer to a USB port on the rear or front panel of the oscilloscope. Alternatively, connect a PictBridge printer to the USB device port on the rear panel or hook up a networked printer through the Ethernet port.

Set Up Print Parameters

To set up the oscilloscope to print hard copies:

1. Push Utility.

3. Turn multipurpose knob a and select Print Setup.

4. Push Select Printer if you are changing the default printer.

   Turn multipurpose knob a to scroll through the list of available printers. Push Select to choose the desired printer.
   To add a non-PictBridge USB printer to the list, plug the printer into a USB host port. The oscilloscope will automatically recognize most printers.
   To set up a PictBridge USB printer, refer to the next topic.
   To add an Ethernet printer to the list, refer to that topic. (See page 131, Printing Over Ethernet.)
5. Select the image orientation (portrait or landscape).

6. Choose **Ink Saver On** or **Off**. The **On** selection will print out a copy with a clear (white) background.
Printing to a PictBridge Printer

To set up the oscilloscope to print to a PictBridge printer:

1. Push Utility.

3. Turn multipurpose knob a and select I/O.

4. Push USB.

5. Push Connect to PictBridge Printer.

To add an Ethernet printer to the list, refer to that topic. (See page 131, Printing Over Ethernet.)
Printing Over Ethernet

To set up the oscilloscope to print over Ethernet:

1. Connect an Ethernet cable to the rear-panel Ethernet port.

4. Turn multipurpose knob a and select Print Setup.

5. Push Select Printer.

7. Turn multipurpose knob a to scroll through the list of letters, numbers, and other characters to find the first character in the printer name that you want to enter.
   If you are using a USB keyboard, use the arrow keys to position the insertion point and type in the printer name. (See page 27, Connecting a USB Keyboard to Your Oscilloscope.)

8. Push Select or Enter Character to let the oscilloscope know that you have picked the proper character to use.

You can use the lower-bezel buttons to edit the name, as needed.

9. Continue scrolling and pushing Select until you have entered all the desired characters.

10. Push the down arrow key to move the character cursor down a row to the Server Name field.

11. Turn multipurpose knob a and push Select or Enter Character as often as needed to enter the name.

12. If desired, push the down arrow key to move the character cursor down a row to the Server IP Address: field.

13. Turn multipurpose knob a and push Select or Enter Character as often as needed to enter the name.

14. When done, push OK Accept.
NOTE. If you have multiple printers connected to the oscilloscope at the same time, the oscilloscope will print to the printer listed in the Utility> Utility Page> Print Setup> Select Printer menu item.

Printing with One Button Push

Once you have connected a printer to your oscilloscope and set up print parameters, you can print current screen images with a single push of a button:

Push the printer icon button in the lower left corner of the front panel.

Erasing Oscilloscope Memory

You can erase all setup and waveform information saved in the nonvolatile oscilloscope memory with the TekSecure function. If you have acquired confidential data on your oscilloscope, you may want to execute the TekSecure function before you return the oscilloscope to general use. The TekSecure function:

- Replaces all waveforms in all reference memories with null values
- Replaces the current front-panel setup and all stored setups with the default setup
- Displays a confirmation or warning message, depending on whether the verification is successful or unsuccessful

To use TekSecure:

1. Push Utility.

3. Turn multipurpose knob a and select Config.
4. Push **TekSecure Erase Memory**.

5. Push **OK Erase Setup and Ref Memory** from the side-bezel menu.

   To cancel the procedure, push **Menu Off**.

6. Power off the oscilloscope, and then power it back on to complete the process.
Using Application Modules

Optional application module packages extend the capability of your oscilloscope. (See page 15, Application Module Free Trial.) You can install up to four application modules at one time. (See page 15, Installing an Application Module.)

Refer to the MSO3000 and DPO3000 Series Oscilloscopes Application Module Installation Instructions that came with your application module for instructions on installing and testing an application module. Some modules are described in the following list. Additional modules may be available. Contact your Tektronix representative or visit our Web site at www.tektronix.com for more information. Also, refer to Contacting Tektronix at the beginning of the manual.

- The DPO3AUDIO Audio Serial Triggering and Analysis Module adds triggering on I²S, Left Justified (LJ), Right Justified (RJ), and TDM buses.
- The DPO3AUTO Automotive Serial Triggering and Analysis Module adds triggering on packet level information in serial buses used in automotive designs (CAN and LIN), as well as analytical tools to help you efficiently analyze your serial bus. These include digital views of the signal, bus views, packet decoding, search tools, and event tables with timestamp information.
- The DPO3COMP Computer Serial Triggering and Analysis Module adds triggering on byte or packet level information in RS-232, RS-422, RS-485, and UART buses, and analytical tools to help you efficiently analyze your serial bus. These include digital views of the signal, bus views, packet decoding, search tools, and event tables with timestamp information.
- The DPO3EMBD Embedded Serial Triggering and Analysis Module adds triggering on packet level information in serial buses used in embedded designs (I²C and SPI), as well as analytical tools to help you efficiently analyze your serial bus. These include digital views of the signal, bus views, packet decoding, search tools, and event tables with timestamp information.
- The DPO3PWR Power Analysis Module adds measurements of power quality, switching loss, harmonics, ripple, modulation, safe operating area, and slew rate.
- The DPO3VID Extended Video Module adds triggering on a variety of standard HDTV signals, as well as on custom (non-standard) bilevel and trilevel video signals with 3 to 4,000 lines.
Application Examples

This section contains ways to use your instrument in both common and advanced troubleshooting tasks.

Taking Simple Measurements

If you need to see a signal in a circuit, but you do not know the signal amplitude or frequency, connect the probe from channel 1 of the oscilloscope to the signal. Then display the signal and measure its frequency and peak-to-peak amplitude.

Using Autoset

To quickly display a signal:

1. Push Autoset.

The oscilloscope sets vertical, horizontal, and trigger controls automatically. You can manually adjust any of these controls if you need to optimize the display of the waveform.

When you are using more than one channel, the autoset function sets the vertical controls for each channel and uses the lowest-numbered active channel to set the horizontal and trigger controls.

Selecting Automatic Measurements

The oscilloscope can take automatic measurements of most displayed signals. To measure signal frequency and peak-to-peak amplitude:
1. Push Measure.

2. Push Add Measurement.

3. Turn multipurpose knob a to select the **Frequency** measurement. If needed, press **Source** from the side menu and turn multipurpose knob b to select the channel from which you want to measure. Push **OK Add Measurement** from the side menu. Repeat this process to select the **Peak-to-peak** measurement.

5. Observe that the measurements appear on the screen and update as the signal changes.

Measuring Two Signals

In this example, you are testing a piece of equipment and need to measure the gain of its audio amplifier. You have an audio generator that can inject a test signal at the amplifier input. Connect two oscilloscope channels to the amplifier input and output as shown. Measure both signal levels and use these measurements to calculate the gain.
Application Examples

To display the signals connected to channels 1 and 2:

1. Push channel 1 and channel 2 to activate both channels.

2. Push Autoset.

To select measurements for the two channels:

1. Push Measure to see the measurement menu.

2. Push Add Measurement.

3. Turn multipurpose knob a to select the Amplitude measurement from the side menu. If needed, press Source and turn multipurpose knob b to select channel 1. Push OK Add Measurement from the side menu. Repeat this process to select channel 2 and again push OK Add Measurement from the side menu.
4. Calculate the amplifier gain using the following equations:

\[ \text{Gain} = \frac{\text{output amplitude}}{\text{input amplitude}} = \frac{3.155 \text{ V}}{130.0 \text{ mV}} = 24.27 \]

\[ \text{Gain (dB)} = 20 \times \log(24.27) = 27.7 \text{ dB} \]

Customizing Your Measurements

In this example, you want to verify that the incoming signal to digital equipment meets its specifications. Specifically, the transition time from a low logic level (0.8 V) to a high logic level (2.0 V) must be 10 ns or less.
To select the Rise Time measurement:

1. Push Measure.

2. Push Add Measurement.

3. Turn multipurpose knob a to select the Rise Time measurement. If needed, press Source from the side menu and turn multipurpose knob b to select the channel from which you want to measure. Push OK Add Measurement from the side menu.

4. Push More repeatedly until you select Reference Levels from the popup menu.
5. Push **Set Levels in** to select **units**.

<table>
<thead>
<tr>
<th>Reference</th>
<th>Levels</th>
<th>Set Levels in</th>
<th>%</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>High Ref</td>
<td>a) 2.00 V</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Mid Ref</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Low Ref</td>
<td>b) 800 mV</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

6. Push **High Ref** and turn multipurpose knob *a* to enter 2.00 V. If needed, push **Fine** to change the sensitivity of the multipurpose knob.

7. Push **Low Ref** and turn multipurpose knob *a* to enter 800 mV. If needed, push **Fine** to change the sensitivity of the multipurpose knob.

Rise time is typically measured between the 10% and 90% amplitude levels of a signal. These are the default reference levels that the oscilloscope uses for rise time measurements. However, in this example, you need to measure the time that the signal takes to pass between the 0.8 V and 2.0 V levels.

You can customize the rise time measurement to measure the signal transition time between any two reference levels. You can set each of these reference levels to a specific percent of the signal amplitude or to a specific level in vertical units (such as volts or amperes).

**Measuring specific events.** Next you want to see the pulses in the incoming digital signal, but the pulse widths vary so it is hard to establish a stable trigger. To look at a snapshot of the digital signal, do this step:

1. Push **Single** to capture a single acquisition. This assumes that the oscilloscope will trigger with the current settings.

Now you want to measure the width of each displayed pulse. You can use measurement gating to select a specific pulse to measure. To measure the second pulse:

2. Push **Measure**.

4. Turn multipurpose knob a to select the Positive Pulse Width measurement. If needed, press Source from the side menu and turn multipurpose knob b to select the channel from which you want to measure. Push OK Add Measurement from the side menu.

5. Push More repeatedly until you select Gating from the popup menu.

6. Select Between Cursors from the side-bezel menu to choose measurement gating using cursors.

7. Place one cursor to the left and one cursor to the right of the second pulse.

8. View the resulting width measurement (160 ms) for the second pulse.

Analyzing Signal Detail

In this example, you have a noisy signal displayed on the oscilloscope, and you need to know more about it. You suspect that the signal contains much more detail than you can currently see in the display.
Looking at a Noisy Signal

The signal appears noisy. You suspect that noise is causing problems in your circuit. To better analyze the noise:

1. Push **Acquire**.

2. Push **Mode** on the lower-bezel menu.

3. Push **Peak Detect** on the side-bezel menu.

4. Push **Intensity** and turn multipurpose knob **a** to see the noise more easily.

5. View the results on the display. Peak detect emphasizes noise spikes and glitches in your signal as narrow as 1 ns, even when the time base is set to a slow setting.

Peak-detect and the other acquisition modes are explained earlier in this manual. (See page 49, *Acquisition Concepts*.).
Separating the Signal from Noise

Now you want to analyze the signal shape and ignore the noise. To reduce random noise in the oscilloscope display:

1. Push **Acquire**.

2. Push **Mode**.

3. Push **Average** on the side-bezel menu.

Averaging reduces random noise and makes it easier to see detail in a signal. In the example to the right, a ring shows on the rising and falling edges of the signal when the noise is removed.
**Taking Cursor Measurements**

You can use the cursors to take quick measurements on a waveform. To measure the ring frequency at the rising edge of the signal:

1. Push channel 1 to select the channel 1 signal.

2. Push **Measure**.

3. Push **Configure Cursors**.

4. Push **Vertical Bar Units** from the side menu, if this choice is not already selected. Turn multipurpose knob a to select **Hz (1/s)** as the unit of measurement.

5. Push **Cursors** repeatedly until the two vertical bar cursors appear on the selected waveform.

6. Place one cursor on the first peak of the ring using multipurpose knob a.
7. If the cursor readout says that the cursors are linked, push **Select** to unlink them.

8. Place the other cursor on the next peak of the ring using multipurpose knob **b**.

9. The cursor $\Delta$ readout shows the measured ring frequency is 227 kHz.
Triggering on a Video Signal

The oscilloscope supports triggering on NTSC, SECAM, and PAL signals.

In this example, you are testing the video circuit in a piece of medical equipment and need to display the video output signal. The video output is an NTSC standard signal. Use the video signal to obtain a stable display.

To trigger on the video fields:

1. Push Trigger Menu.

2. Push Type.

3. Turn multipurpose knob a to scroll through the trigger type side menu until you select Video.

4. Push Video Standard, and turn multipurpose knob a to scroll through the standards until you select 525/NTSC.

5. Push Trigger On.

If the signal had been noninterlaced, you could choose to trigger on All Fields.
7. Turn the **Horizontal Scale** knob to see a complete field across the screen.

8. View results.
Application Examples

**Triggering on Lines**

**Triggering on Lines**. To look at the video lines in the field:

1. Push Trigger Menu.

2. Push Type.

3. Turn multipurpose knob a to scroll through the trigger type side menu until you select Video.

5. Select All Lines.
   To trigger on a specific line, select Line Number, and use multipurpose knob a to select the line number.

6. Adjust Horizontal Scale to see a complete video line across the screen.
7. Observe the results.

Capturing a Single-Shot Signal

In this example, the reliability of a reed relay in a piece of equipment has been poor, and you need to investigate the problem. You suspect that the relay contacts arc when the relay opens. The fastest you can open and close the relay is about once per minute, so you need to capture the voltage across the relay as a single-shot acquisition.

To set up for a single-shot acquisition:

1. Adjust the Vertical Scale and Horizontal Scale to appropriate ranges for the signal you expect to see.
2. Push Acquire.
4. Select Sample.
5. Push Trigger Menu.
7. Turn the Trigger Level knob to adjust the trigger level to a voltage midway between the open and closed voltages of the relay.
8. Push **Single** (single sequence).
When the relay opens, the oscilloscope triggers and captures the event. The **Single** sequence button disables auto triggering so that only a valid triggered signal is acquired.

### Optimizing the Acquisition

The initial acquisition shows the relay contact beginning to open at the trigger point. This is followed by large spikes that indicate contact bounce and inductance in the circuit. The inductance can cause contact arcing and premature relay failure.

Before you take the next acquisition, you can adjust the vertical and horizontal controls to give you a preview of how the next acquisition might appear. As you adjust these controls, the current acquisition is repositioned, expanded, or compressed. This preview is useful to optimize the settings before the next single-shot event is captured. When the next acquisition is captured with the new vertical and horizontal settings, you can see more detail about the relay contact opening. You can now see that the contact bounces several times as it opens.

### Using the Horizontal Zoom Function

To take a close look at a particular point on the acquired waveform, use the horizontal zoom function. To look closely at the point where the relay contact first begins to open:

1. Turn the **Zoom** knob.
2. Turn the **Pan** knob to place the center of the zoom box close to where the relay contact begins to open.

3. Turn the **Zoom** knob to magnify the waveform in the zoom window.

The ragged waveform and the inductive load in the circuit suggest that the relay contact may be arcing as it opens.

**Correlating Data with a TLA5000 Logic Analyzer**

To troubleshoot designs with fast clock edges and data rates, it helps to view analog characteristics of digital signals in relation to complex digital events in the circuit. You can do that with iView, which lets you transfer analog waveforms from the oscilloscope to the logic analyzer display. You can then view time-correlated analog and digital signals side-by-side, and use this to pinpoint sources of glitches and other problems.

The iView External Oscilloscope Cable allows you to connect your logic analyzer to a Tektronix oscilloscope. This enables communication between the two instruments. For DPO3000 series oscilloscopes, you also need a TEK-USB-488 adaptor. The Add External Oscilloscope wizard, which is available from the TLA application System menu, guides you through the process of connecting the iView cable between your logic analyzer and oscilloscope.

The TLA also provides a setup window to assist you in verifying, changing, and testing the oscilloscope settings. Before acquiring and displaying a waveform, you must establish a connection between your Tektronix logic analyzer and oscilloscope using the Add External Oscilloscope wizard.
To do this:

1. Select **Add iView External Oscilloscope** from the logic analyzer System menu.
2. Select your model of oscilloscope.
3. Follow the on-screen instructions, and then click **Next**.
4. See your Tektronix Logic Analyzer documentation for more information on correlating data between your Tektronix oscilloscope and logic analyzer.
Tracking Down Bus Anomalies

In this example, you are testing your new I2C circuit. Something is not working. You tell the master IC to send a message to the slave IC. Then you expect to receive data back and an LED to light. The light never goes on. Where in the ten or so commands that were sent out did the problem occur? Once you locate the problem location, how do you determine what went wrong?

You can use your oscilloscope, with its serial triggering and long-record length management features, to track down the problem in both the physical layer and in the protocol layer of the bus.

Basic Strategy

First, you will display and acquire the bus signal by setting up the bus parameters and trigger. Then, you will search through each packet with the search/mark functions.

1. Connect the channel 1 probe to the clock line.
2. Connect the channel 2 probe to the data line.
3. Push Autoset.
4. Push the B1 button and enter the parameters of your I2C bus in the resulting screen menus.
5. Push Trigger Menu.

6. Push Type to select Bus. Enter trigger parameters in the resulting screen menus.

<table>
<thead>
<tr>
<th>Type</th>
<th>Source</th>
<th>Trigger On</th>
<th>Address</th>
<th>Direction</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bus</td>
<td>Bus</td>
<td>On</td>
<td>07F</td>
<td>Read</td>
<td>Auto</td>
</tr>
</tbody>
</table>

7. Analyze the physical layer. For example, you can use the cursors for manual measurements. (See page 103, Taking Manual Measurements with Cursors.) You can also use the automated measurements. (See page 96, Taking Automatic Measurements.)

8. Push Search. Set Search Marks to On. Enter a search type, source, and other parameters as relevant on the lower-bezel menu and associated side-bezel menus. (See page 114, Using Wave Inspector to Manage Long Record Length Waveforms.)

9. Jump ahead to the next search point by pushing the right arrow key. Push it again and again until you see all the events. Jump back with the left arrow key. Do you have all the packets that you expected to have? If not, at least you have narrowed your search down to the last packet sent.

10. Analyze the decoded packets in the protocol layer. Did you send the data bytes in the correct order? Did you use the correct address?
Troubleshooting an RS-232 Bus

In this example, you are looking at analog characteristics of a digital signal in a digital circuit. You are doing this to analyze the signal integrity of a signal. For example, you might be testing RS-232 bus signals.

**Basic Strategy**

First, you will display and acquire the digital signal. Then, you will look at both the analog and digital representations of the signal. Finally, you will search through each RS-232 byte with the search/mark functions.

**NOTE.** Triggering on RS-232 bus signals requires use of the DPO3COMP Serial Triggering and Analysis Module. (See page 15, Application Module Free Trial.)

1. Connect the desired analog probe tip to the desired test point.

3. Push Autoset.

5. Push the Bus B1 lower-bezel button, use multipurpose knob a to select RS-232, and enter the parameters of the bus in the resulting screen menus.
6. Push the **Bus Display** lower-bezel button, push the **Bus and Waveforms** side-bezel button, and push the **ASCII** side-bezel.

7. Turn the Horizontal Scale knob to adjust the timebase.
   As you increase the time per division, you will see more data appear in the Bus display.

8. Push **Trigger Menu**. Select the **Bus** trigger type. Define what type of condition to trigger on, such as the Tx Start Bit.

9. Push **Search**, push the **Search** lower-bezel button, and select **On** in the side-bezel menu.

10. Push **Search Type**. Use multipurpose knob to select Bus. Push **Search For** and select the desired search, such as for the Tx Start Bit.

11. Push the Previous and Next Mark buttons to navigate through the record.

12. Push **Zoom** and Pan to see the areas of interest and analyze the results.
Troubleshooting Circuits Using Parallel Buses

In this example, you are monitoring a parallel bus with your oscilloscope. You can use your MSO3000 Series oscilloscope with its 16 digital channels to analyze the bus. The MSO3000 Series will not only let you see the on-off status of the signals, but will also decode the parallel bus signals for you.

Basic Strategy

First, you will display and acquire the digital signals. Then, you will search through the data with the search/mark functions.

NOTE. The MSO3000 Series oscilloscopes support triggering and decoding on Parallel bus signals.

1. Connect the desired digital probe tips to the desired test points. For simplicity, this example connects to a 7-bit counter.

2. Push Default Setup. Then push the channel 1 button to remove the waveform from the display.

3. Push the D15-D0 button.

4. Push the D15-D0 On/Off lower-bezel button and then push the Turn On D7-D0 side-bezel to display the digital waveforms. To turn off a channel, use multipurpose knob a to select the channel and push the Display side-bezel to select Off.
5. Push **Autoset**.

6. Push the **B1** button, select Parallel as the bus type. Push the lower-bezel **Define Inputs** and enter the parameters for your bus for Clocked Data, Clock Edge, the Number of Bits, and Define Bits.

7. Turn the Horizontal Scale knob to adjust the timebase.
   As you increase the time per division, you will see more data appear in the Bus display.

8. Push Trigger **Menu**. Push **Type**, select **Bus**, and enter the parameters of the trigger, such as the Source Bus and Data. Define the Mode and Holdoff as desired.

9. Push **Search**, push the **Search** lower-bezel button, and select **On** in the side-bezel menu.

10. Push **Search Type**. Use the multipurpose knob **a** to select **Bus** and then push **Data**. Use the multipurpose knobs **a** and **b** to define the data value.

11. Push the Previous and Next Mark buttons to navigate through the record.

12. Push Zoom, and Pan to the areas of interest to analyze the results.

Delta Time Measurement Accuracy

The formula to calculate delta-time measurement accuracy (DTA) for a given instrument setting and input signal is given below (assumes insignificant signal content above Nyquist):

1. \( SR_1 = \) Slew Rate (1st Edge) around the 1st point in the measurement
2. \( SR_2 = \) Slew Rate (2nd Edge) around the 2nd point in the measurement
3. \( N = \) input-referred noise (volts rms, Refer to the Random Noise, Sample acquisition mode specification)
4. \( t_p = 1 / \) (Sample Rate)
5. \( TBA = \) timebase accuracy (Refer to the Long-term sample rate and delay time accuracy specification)
6. \( RD = \) (Record Length) / (Sample Rate)

\[
DTA_{FP} = \pm 5 \times \sqrt{\left( 2 \left( \frac{N}{SR_1} \right)^2 + 2 \left( \frac{N}{SR_2} \right)^2 + (5 \text{ ps} + 1 \times 10^{-6} \times RD)^2 + 2 \times t_p + TBA \times t_p \right)}
\]

\[
DTA_{RMS} = \sqrt{\left( 2 \left( \frac{N}{SR_1} \right)^2 + 2 \left( \frac{N}{SR_2} \right)^2 + (5 \text{ ps} + 1 \times 10^{-6} \times RD)^2 + \frac{240}{\sqrt{12}} \right) + TBA \times t_p}
\]

Assumes that error due to aliasing is insignificant.

The term under the square-root sign is the stability, and is due to TIE (Time Interval Error). The errors due to this term occur throughout a single-shot measurement. The second term is due to both the absolute center-frequency accuracy and the center-frequency stability of the timebase and varies between multiple single-shot measurements over the observation interval (the amount of time from the first single-shot measurement to the final single-shot measurement).
